Youve either got a floppy bootsector disabling it or its a setting in
your NVRAM, so BOOTCONF from Uwe Siemet will do the job i believe.

If you are doing alot of manipulation with strings, gfa has an
annoying problem where it will eat up all it's string space
over time. This might be the problem you are having.

> This works fine except that I run out of memory for large directories.
> I can get around this by reserving a huge chunk of memory when
> compiling (2 megs), but why should this happen? How can I get OPEN
> #1 and OPEN #2 to use the same memory block each pass?

Put this somewhere in the loop or before each file pass:

```
  VOID FRE(0)
or
  ~FRE(0)
```

depending on your version of gfa-basic.

The zero parameter is important, it forces an internal garbage
collection of all unused string space and should in a sense free it.
Just FRE() with no parameter will return the free space without
causing a garabge collection.

Hope this helps...

I tried this out and no files were written. The program stopped the
first time it came to ~FRE(0).

I guess a workaround is to calculate the available memory and then
notify the user how many files can be processed at one time.

That is very strange, it should not stop the program.
I have no idea how you are using memory, or allocating it,
or buffering data. Hard to say what is going on, but ~FRE(0)
does not stop my programs on my system.

I shouldn't say stop the program, but it behaved as though it ran out
of memory immediately.

The program was starting with a RESERVE -(whatever) command. I also
tried MALLOC and the corresponding GEMDOS command.

They work fine in the interpreter but the compiled programs seem to
require $m(whatever). If I leave this out the compiled program
crashes with 2 bombs.

As a workaround I'm using $m(40000000) - to make sure I grab all the
memory, and then testing for available memory using FRE(0) and then
advising the user how many files he can process with that amount of
memory. This is acceptable, I think.

Hi,

What can it be: "Out of internal memory. Use Folder100.prg" ???

Folder100.prg is installed. 14MB of RAM and about 9 MB is still free.

Try renaming folder100.prg to folder999.prg. If that still isn't enough,
copy folder999.prg to folder998.prg.

Salut/.

J/.

If I recall correctly if you are using the folderXXX.prg there
is another patch that is common to use along with this called
cacheXXX.prg. Both patch different parts of the OS.
I do not have this patch, as HD Driver (fine product btw)
has these things built into it.

It's common knowledge that the reserve command should be avoided
in compiled apps. It might be ok for testing in the editor, but I never
use this command myself.

> They work fine in the interpreter but the compiled programs seem to
> require $m(whatever). If I leave this out the compiled program
> crashes with 2 bombs.

Without the compiler command $mXX your compiled app will take
all available ram, thus there won't be any ram left in the
system to allow calls to malloc().

$mXX tells the compiled app how much ram to keep, and gives the
rest back to the system.

> As a workaround I'm using $m(40000000) - to make sure I grab all the
> memory, and then testing for available memory using FRE(0) and then

From my own projects, I've found the best method to be:
1) Don't use reserve (only use this in editor for testing)
2) Always use $mXX (especially important under multi-tasking)
3) Use malloc() to get ram as needed and mfree() to free it
4) Use ~FRE(0) to clean up the string area regularly

Perhaps someone else into GFA wishes to add to this?
I use my own advise in AtarIRC, it seems to work ok for me. ;-)

I'll try it again with your suggestions.

Sometimes weird things happen with GFA...on this same project I had
two versions of the same program - THIS.GFA and THAT.GFA. I
incorporated a progress bar into THAT.GFA and it worked fine, so I
included the same code into THIS.GFA - absolutely no go. I printed
out the code and checked minutely...they were exactly the same, but
one worked and the other one exited as soon as it got to the progress
bar. I rebooted, ran one program first and the other second, another
reboot, running the reverse order, the second program just didn't
work. I finally pasted the code from one to the other procedure by
procedure, eliminating the old procedures, and got it to work.

Hi Rafal!

RK>What can it be: "Out of internal memory. Use Folder100.prg" ???
RK>Folder100.prg is installed.
Rename it to Folder200.prg (or whatever number you want/need). The number in the filename is used as a parameter

RK>14MB of RAM and about 9 MB is still free.
Internal memory is allocated statically and to enlarge it's amount you have to use Folderxxx.prg

Bye

Joerg

The right answer is to set the boot delay to 32. It has the side effect
of enabling the RAM test.

Petr

The above would be really nice, what about some 3D object, z-buffering, etc
which is also built into many of the modern cards (don't know if cards like
Eclipse or Galaxy do though).

With the original problem in mind, could there not be some kind of
"fullscreen" call which would allow you to request a resolution based on W x
H x D (maybe pages) that were passed, with an error returned if the computer
was not capable?

This is all getting along the lines of (dare I say it) DirectX kind of
stuff, but I am sure the implementation would be far batter.

Mark.

The RageII supplied with the Eclipse does have 3D support. It was one of
the first mainstream cards with that, though, so it is of course lightyears
from today's cards.
Unfortunately, I don't have any documentation for those parts. It might
be possible to dig out something from various Linux graphics driver code,
but I'm not promising anything.
It's more likely that I'll put some effort into these kinds of things for
3DFX Banshee/Voodoo3/4/5 or S3 Virge since I do have what appears to be
complete documentation for those. So far I only have the beginnings of
the 2D driver for the Banshee, though.
(I have at least a dozen different PCI video cards in a pile here.)

The Galaxy uses a (reasonably large) FPGA (Field Programmable Gate Array),
so it could certainly be made to do 3D if someone put their mind to it.
To my knowledge, there's nothing like that now, though.

>With the original problem in mind, could there not be some kind of
>"fullscreen" call which would allow you to request a resolution based on W x

Certainly. It's easy enough to do in the fVDI/RageII driver.

>This is all getting along the lines of (dare I say it) DirectX kind of
>stuff, but I am sure the implementation would be far batter.

Without breaking with the entire VDI API (horrible low level interface
and very limiting, IMHO), that is not likely.

99% or so of the DirectX functionality would in any case be completely
out of the question for performance and effort reasons.

Lonny

I've been trying out your suggestions - use $mxx, use malloc() and mfree(), use ~fre(0) to clean up string area.

It doesn't seem to work with FSFIRST and FSNEXT for reading a directory. On the first occurance of ~FRE(0) the program exits as though reaching the last file in the directory.

I made a copy of an article to get directories using something like
FSFIRST and FSNEXT, but haven't gotten around to chaing my GFA basic progs
that use the old 'write to disk then load' method. I can pursue it.

Are you reserving the string space outside the load/modify/write
routines? And making sure to reset the pointer to the start of the
string(cnt=1) ?

If you are accessing a hard drive or cdrom drive with lots of folders,
then even 100 may not be enough. Most ST Oses have a patch to fix the
problem with "not flushing the folder buffer when the window is closed
and another partition is read".

Have you tried changing it from 100 to 250? Also, make sure you have the
right prog for the computer you are using.(ST/TT/Falcon frequently use

different versions). And it may have gotten corrupted.

And finally, the error isn't necessarily with the folder program, its
just the first one that could print out an error message. See whats in
the boot chain that follows it in the auto folder.

Now that you mention it...I don't think the string space was
reserved...

I'll try that out and report back. Thanks.

I wanted to add, just using ~FRE(0) is not some cure all, especially
if you have some other command somewhere eating up gfa's internal
memory area. Like using temporary numeric arrays and forget to
free them and the like. Also if you don't mind me looking over the
code, I was suggesting you send it directly to me, not post it on
usenet. ;-)

That is very strange. Is this project something you wish not
to allow ppl to see? I have never had a problem with ~FRE(0)
and would like to see what is going on with it on your end if that
is possible. If not I can understand. ;-)

I use ~FRE(0) in my IRC program without any problems, and it runs
on ST's, Falcons, and up, even on my Hades060 it's fine.

```

The code you have provided will only work if the software is running on a 68010 or newer CPU, and the code calling GEMDOS was in the 68k's Supervisor mode before the call.

A better approach would be something like this:

(I've taken advantage of the fact that GEMDOS is documented to destroy the three lowest data and address registers. This code is also XBRA compliant, calling the previous handler if it isn't Cconws being called)

```
        dc.l    'XBRA'        ; XBRA compliant
        dc.l    'CCWS'        ; XBRA flag identifying this handler
oldhandler    ds.l    1        ; old handler address
trap
    lea    6(sp),a0    ; opcode offset for supervisor call
    move.l    usp,a1    ; get user stack
    tst.w    $5a0.w    ; big frame? (68010+ have 8 byte frame)
    seq    d0                ; set small frame flag
    beq.s    smallerframe    ; no - it's a 68000 or 68008
    addq.l    #8-6,a0    ; increment stack pointer
smallerframe
    btst    #13&7,(sp)    ; were we called from user mode?
    sne    d1                    ; set "called from super" flag
    bne.s    calledfromsuper    ; no, so skip it
    move.l    a1,a0        ;  a0 = USP
calledfromsuper
    cmp.w    #CCONWS,(a0)    ; was the called func Cconws() ?
    beq.s    myhandler                    ; no, so go to my handler
    move.l    oldhandler(pc),-(sp)    ; push address of old handler
    rts                                     ; jump to it

myhandler:
    move.l    trapstack,a1    ; get old frame stack
    move.w    (sp)+,-(a1)    ; pop stacked SR, push onto my stack
    move.l    (sp)+,-(a1)       ; pop stacked PC, push onto my stack
    tst.b    d0                        ; small frame flag set?
    beq.s    shortframe          ; yes, so no "format word" to transfer
    move.w    (sp)+,-(a1)    ; pop stacked format-word, push onto my
stack
shortframe
    move.l    sp,-(a1)                ; save old stack pointer
    move.l    a1,trapstack    ; save new stack pointer
```

```
    tst.b    d1    ; called from supervisor?
    bne.s    supercall    ; yes - no need to swap stacks
    move.l    usp,sp    ; set sp to point to user stack
supercall

    jsr    myCconwshandler    ; call handler with params on stack

    move.l    trapstack,a0    ; fetch my stack pointer
    move.l   (a0)+,sp        ; pop old stack
    tst.w        $5a0.w        ; long frame or short?
    beq.s    returnfromshortframe
    move.w    (a0)+,-(sp)    ; pop saved formatword, push onto stack
returnfromshortframe
    move.l    (a0)+,-(sp)       ; pop saved PC, push onto stack
    move.w    (a0)+,-(sp)    ; pop saved SR, push onto stack
    move.l    a0,trapstack    ; save trap stack pointer
    rte                               ; return to prog/func that called
me

; sp+0       stack pointer
; sp+4        Cconws func num
; sp+6        string pointer
myCconwshandler
    move.l    4+2(sp),a0    ; fetch string to be printed

    nop                ; do whatever you wanna do

    rts                ; normal subroutine return, to trap handler

    SECTION DATA
trapstack
    dc.l    stacktop        ; saved pointer to stack of old GEMDOS trap
frames

    SECTION BSS
    ds.b    12*16    ; 16 level stack of 12-byte (stackframe+SP)
stacktop

    END
```

(Better, more-efficient code could probably be written, but this should give you an idea of what should work. I haven't actually tried this code, having written it while online)

Hi there,

I have a problem using standard VDI functions to paste images from
memory.
I'm working with 8 bitplanes....
So, the highest color is 255 (0-255) and if I use such color, system
changes it to 1..
Why?? Can someone help me?

Unluckily I don't have access to my sources at the moment so I can't
tell you the exact mapping but I had a similar problem when loading
and displaying images and after some trial and error I coded a
function to map the colours. IIRC with 8 bitplanes VDI mixes up
colours 0 to 15 and 255, at 4 bitplanes it mixes up only colours
0 to 3 and 15 but why it does that at all is beyond me.
I could tell you the mapping after the weekend but until then I think
you will have found it out yourself since you can see it at once if
you draw a picture with e.g. PixArt, and then load and display it
with a tiny self written program.

No, tell me. Probably I'll have no time for solving this problem...
BTW. The color 254 is 254. There are problems only with 255 :(

You have to hook XBIOS vectors, this is what I did in MIKENET software, maybe
I still have that big all ASM sources around, left at the point where I
started to use the parallel port instead of the MIDI ports.

As I said colors 16 to 254 all are correct. That's what I'm sure.
What I'm not sure to remember correct is :

0 - 0
1 - 255
2 - 1
3 - 2
4 - 3
.
.
15 - 14
255 - 15

You can try it that way and if it's not correct I can tell you after
the weekend.

Hmmm, pretty smart ;)
But is the system doing such things ???
I'll try this, but anyway show me your solution after the weekend...

It would be really nice to have a look at your code. Coulde you mail it to me? :-)

I would like to thank all you others too who replied to my questions. All your solutions seem equally good too me, but I think I'll try TraPatch combined with the MIKENET sources, and see what I can come up with. I've save your replies for future reference.

You can't add a non-FAT FS by hooking into XBIOS - Gemdos will handle the drive internally and access it on a sector-by-sector basis, and assume there is a FAT FS on it.

He wanted to have a network drive (where there probably is *no* FAT FS on
the other end, eg. when running on some UNIX machine), so he has to
intercept Gemdos directly and pass the file access functions across the net.

Yepp, what I'm trying to do is make files in an ordinary

window$-environment accessible on an atari through the network. I think
the best solution would be to forward the necessary gemdos calls (like
Fopen and Fread for instance), and not try to read sectors from a
partition under window$, since it would certainly not like that.

Lightspeed C was pretty good. It was an integrated development environment,
its own DOS and editor for writing programs vs "use your favorite WP" type
of stand alone compiliers.

Can't remember which one I fooled with, could have been CC65, but it
understood braces
for {
vs
for $(

Like you have to do with most Atari C compilers.

> 255 -> 1 !!!

The VDI always uses 0 for white and 1 for black.
The XBIOS uses 0 for white and the highest possible value for black.
3, 15, 255 respectively.

On the TT in duochrome 254 and 255 are used.

More general: vs_color(h,0) is background colour, (h,1) is foreground colour,
to make these notions the same on all colour depths.

Oh yes right, this is why MikeNet was so fast and relayable, and I had big
problems while starting to think to a multipoint real network, to other
platforms too.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

The best assembler is MAC/65 I think but I have seen several other good
assemblers for the 800XL...
For the best C compiler you can use CC65 for 800XL it's not supported
anymore, but still very good. The only problem is you need a big ramdisk or
harddisk to use the compiler/linker with all libs...
But CC65 is also available as cross-compiler for PC. You can find it at
WWW.CC65.ORG it's still supported and you can download the latest version
there...A lot of Atari 8-bit support is added lately...

I've never stopped supporting it. Check out-

http://members.nbci.com/cc65foratari/

It has the cross compiler version available for downloading, plus some
libraries and source code. It is completly compatable with the J.R.
Dunning version and libraries, and includes his cool multi-pass executables
that make the forward referencing of symbols a snap without the use of alot
of header files or declarations.

I am trying to modify some games for Atari 2600 using DASM
when I try to assemble a program, i get unknown mneumonic messages for
every instruction:
line 47 colrdemo.asm Unknown Mnemonic
unknown mnemonic: 'DEX'
line 48 colrdemo.asm Unknown Mnemonic
unknown mnemonic: 'BNE'

Anyone know why this would happen?
Also let me know if there is a better newsgroup to use for this type
of stuff.

Hi there,

Is there any possibility to know that in your Falcon NOVA Card is
installed?
If yes, then how?

And another question concerning the NOVA card.
If I use standard MFDB structure what should I change to display it
correctly on NOVA card.
SwapByte in mfdb->fd_addr ?

If you can display over 256 colors then you have the Nova card. I believe a
regular Falcon could not display over that amount.

I wouldn't go this route, unless there was some really big incentive to do it. The reason being if you avoid checking for specific hardware and look more at the reported capabilities of the system from the vdi workstation, you do not lock the program into one particular configuration. Ie Does your prgram do something special on a Nova Card that could just as easily be done on an Eclipse?

Also it's questionable to try and shrink your potential userbase if you are hoping for any sort of return from the product.

If you are using the VDI, no change should have to be made. The driver handles any conversions that might need to be done.

Dan Ackerman
aka baldrick@netset.com

ps. When are we going to see snapshots of Tales of Tamar for the Atari?

No, I'm just showin some pictures on the screen ;))
But one of my tester reported me that there are some problems when he uses
NOVA Card (I have a screen shot).

> Also it's questionable to try and shrink your potential userbase
> if you are hoping for any sort of return from the product.

No, I'm only trying to make my programm compatible also with NOVA not only
with standard Falcon.

So why the picture is deformed?
I'm using standard VDI calls (vro_cpyfm)...

> ps. When are we going to see snapshots of Tales of Tamar for the Atari?

:))
Tales of Tamar will be only a port of Amiga game, so it will be exactly the
same as on Amiga (it'll look exactly the same).
You can see snapshots on www.tamar.net :-))

Well what programming language are you using That would probably
be the next question. It is probably something very small as I saw this
hapen with my code before. Work for most people and then one person was
getting garbage. It was one of a few things for me. The manner in which
I was setting the base address for the screens MFDB, the manner in which I
was clearing a buffer, or the definition I was giving the buffer. Sorry I
can' be more exact than that, but without knowing if you are using C, ASM
or GFA it makes it a bit hard to be exact on some of that. Those were
also the changs that I put in place that cleared up the problem for that
particular user. So I'm not certain exactly which one it was.

     I mentioned a few things above that might be your problem.

In C they would be the following.

```
screen_mfdb.fd_addr = 0L;  /* I've had other settings work for some but
not all setups */

vro_cpyfm(vdi_handle,(screen_planes >
9)?ALL_BLACK:ALL_WHITE,array,&pic_buf,&pic_buf);
/* not memset.  Memset works with atari hardware, but can be problematic
with a graphics card */

picture_buffer = (short *)malloc(....)
/* I had this one recommended to me ;) */
```

Arcade,

Your must include the following line in the source code

<seven spaces>processor 6502

then compile

To make a good binary, your command line should look like this:

dasm source.s -f3 -osource.bin

Good luck,
Bill

Hi!

I wrote some questions about a network filesystem I wanted to code, a few weeks ago (the subject was "adding new drives to gemdos" I think). I got numerous responses on my questions, enough to get me started. The whole idea was to hook into gemdos functions so that I could forward certain function calls (like Fopen, Fcreate and so on) to the "fileserver". The fileserver would run on a linux system, to make things easy. One advice I got was to make my gemdos functions reentrant. I don't think I understood clearly what that meant, but I suspect it means that many processes should be able to call my routines at the same time without risk of collisions. And I've come up with one problem that I don't know how to solve: I want the whole network filesystem to be runnable under normal TOS, which implies that I need to cover the Fsfirst and Fsnext functions (and also Fsetdta). With only one process as with normal TOS, there's no problem, as long as the process has called Fsetdta, so that my routines know which DTA to fill in when Fsfirst and/or Fsnext is called. BUT with multiple processes I need to know somehow which process called Fsetdta, and also Fsfirst/Fsnext, so that I don't fill in the wrong DTA. Any ideas? The original Gemdos must have a way to do this, but I don't know anything about it.

Regards
Henrik

Hello Henrik,

Wouldn't the Dopendir/Dreaddir/Dclose dir functions help ? I guess they already know how to deal with your problem (in a multitasking environment) so it's no use trying to redo the same thing, maybe you can just try to map your Fsfirst/Fsnext with these calls ?

> processes I need to know somehow which process called Fsetdta, and also
> Fsfirst/Fsnext, so that I don't fill in the wrong DTA. Any ideas?

What about adding a _DTA* parameter to your Fsfirst to tell it what structure it should fill ?
Also, if you need to identify a process, Pgetpid() is for you !

> The
> original Gemdos must have a way to do this, but I don't know anything
> about it.

Why don't you have a look at the FreeMiNT sources ? Even if it's not the original GEMDOS it's compatible so it will give you an idea of how things can be done ?

Vincent

According to the book'le livre du d?veloppeur de l'Atari ST',
and to the STonX Gemdo emulation sources, it seems that
- the _dta is available from the active program's basepage
  (offset 0x20 from the basepage)
- the basepage of the current active basepage is in
  *((char**)(_sysbase+0x40)), where _sysbase = *((char**)0x4F2)
Hope it helps.
Laurent

Hi Henrik!

GH>One advice I got was to make my gemdos functions reentrant. I don't
GH>think I understood clearly what that meant, but I suspect it means
GH>that many processes should be able to call my routines at the same
GH>time without risk of collisions.
Yes, that's it. Most important is not to use any global variables

GH>With only one process as with normal TOS, there's no problem, as long
GH>as the process has called Fsetdta, so that my routines know which DTA
GH>to fill in when Fsfirst and/or Fsnext is called. BUT with multiple
GH>processes I need to know somehow which process called Fsetdta, and
GH>also Fsfirst/Fsnext, so that I don't fill in the wrong DTA. Any ideas?
Use Fgetdta().
It works even if the process hasn't called Fsetdta() (it then returns the
default DTA) and you can also call it from inside an AES/VDI/GEMDOS trap

Bye

Joerg

What kind of problem is there with the display?

If you're trying to create device specific MFDBs yourself, things can
go wrong unless you use the right way to figure out the screen layout.
I've had lots of problems trying to get all programs working correctly
on the Eclipse/RageII.

>I was setting the base address for the screens MFDB, the manner in which I

It should always be zero.

>>So why the picture is deformed?

Deformed how?

>>I'm using standard VDI calls (vro_cpyfm)...

See above regarding device specific MFDBs.

>screen_mfdb.fd_addr = 0L; /* I've had other settings work for some but
>not all setups */

This will work with any non-buggy VDI.
Putting an actual screen address in there may not even be possible, since
there might not be one (and asking the XBIOS for it isn't a terribly good
idea). At the very least, it makes the job harder for the VDI in the case
of graphics cards.

>vro_cpyfm(vdi_handle,(screen_planes >
>9)?ALL_BLACK:ALL_WHITE,array,&pic_buf,&pic_buf);
>/* not memset. Memset works with atari hardware, but can be problematic
>with a graphics card */

Please, don't do that when trying to fill an area of the screen with black/white! Sure, it will probably work fine for your program (but not necessarily since there _are_ actually 8 bit true colour modes around), but some old programs always use the ALL_WHITE (a terrible name) mode. The only way to get those old programs to work right is to make the VDI change the blit calls from D=0 to D=1 and vice versa, which fVDI can do if asked. Now, if some program does the 'correct' thing, that one will fail instead, since there is no way the VDI can know which is which.

There are perfectly fine area filling functions (v_bar/vr_recfl) which will always do the job (well, at least if you make sure you use the correct colour index) right.

If you're clearing/setting an off screen buffer there is obviously no problem with memset().

```
>picture_buffer = (short *)malloc(....)
>/* I had this one recommended to me ;) */
```

What's special about that one? The short*?

In C, the void* returned by (modern) malloc will automatically be casted to whatever pointer type picture_buffer has. By casting explicitly, you remove the possibility for the compiler to flag if you'd forgotten to include stdlib.h (in which case malloc will be assumed to return int).

If you want the code to compile as C++ too, you do need the cast (but in C++ you should of course not be using malloc in the first place ;-).

I am trying to learn how to use Object GEM but I am not
doing very well.

Using some example code I have managed to open the application
and set-up the menu as well as drawing a dialog box.

I want to be able to enter some data into two input fields.
Next, pressing a button will allow some processing to be done
and the results returned to two output fields.

Pretty simple I would have thought but it isn't working
that way.

I have pasted a chunk of the code below, you can probably
guess what it's going to do ;-)

Could someone point out what I am doing wrong ?

TIA

Peter

I put a new version of FSLog up on my web site.

http://www.netset.com/~baldrick/stikapps.html

I thought that I would announce it here as it's been tested and works with GlueSTiK now as well. And GlueSTiK programmers may not follow my normal STiK2 announcements.

FSLog is a logging utility for STiK API calls. New version allows some options on what is logged.

Complete source code in C is included in the archive.

Dan Ackerman
aka baldrick

I'm confused by what you are saying here. In the first line ou

say use this method. But in your second quote you talk like this not necessarily the best method.

```
>>vro_cpyfm(vdi_handle,(screen_planes >
>>9)?ALL_BLACK:ALL_WHITE,array,&pic_buf,&pic_buf);
>>/* not memset.  Memset works with atari hardware, but can be problematic

>necessarily since there _are_ actually 8 bit true colour modes around),
```

8 bit true color mode? That's an interesting confusion. Since Atari accepted an 8 bit planar mode with the TT, it would seem to me that an 8 bit true color mode would be a non standard construction that should be avoided.

```
>but some old programs always use the ALL_WHITE (a terrible name) mode.
>The only way to get those old programs to work right is to make the VDI
>change the blit calls from D=0 to D=1 and vice versa, which fVDI can do
>if asked. Now, if some program does the 'correct' thing, that one will
>fail instead, since there is no way the VDI can know which is which.
>
>There are perfectly fine area filling functions (v_bar/vr_recfl) which
>will always do the job (well, at least if you make sure you use the
>correct colour index) right.
>
>If you're clearing/setting an off screen buffer there is obviously no
>problem with memset().
>
```

Actually there is. There are NOVA cards out there that use some strange bit in there driver. Don't ask me what they do, but memset() on an offscreen buffer for these cards leads to corrupted displays. This is why I use the slower but more compatible (since it works through the VDI of the card) in place vro_cpyfm(). If the cards driver are doing something strange then this should (and seems to) take that into consideration.

```
>>picture_buffer = (short *)malloc(....)
>>/* I had this one recommended to me ;) */
>
>What's special about that one? The short*?
>
>In C, the void* returned by (modern) malloc will automatically be casted
>to whatever pointer type picture_buffer has. By casting explicitly, you
>remove the possibility for the compiler to flag if you'd forgotten to
>include stdlib.h (in which case malloc will be assumed to return int).
>
```

What is the real chance of someone not noticing the lack of

#include <stdlib.h>? There are quite a few other routines in there that are more than likely going to appear in a section of code dealing with image decompression. Now why the Cast? Well if you noticed in this thread both the original questioner and myself are both using PureC, which is just about anything you want to say except a modern compiler ;)

>regular Falcon could not display over that amount.

Not correct! As manufactured, the Falcon could display 64,000-odd colours but only in ST-Low resolution (320*200). With the help of Videlity, it can do TrueColor at higher resolution too, though it's better if Nemesis is fitted or the machine slows down too much.

No, in the second line I'm saying that you shouldn't try to put an
actual screen address there. 0 obviously isn't a screen address. ;-)

Use the zero.

> 8 bit true color mode? That's an interesting confusion. Since

No confusion. I've seen several variations.
Even without actual hardware support, you can of course set up the
palette to give, say 3 bit red, 3 bit green, and 2 bit blue.
(Actually, the new palette NVDI introduced with v5 seems to be based on
 this principle (it makes it a lot easier to map 16/24 bit images to 8 bit)).

>an 8 bit true color mode would be a non standard construction that should
>be avoided.

Well, yes.

But then that VDI is in error, since those vro_cpyfm modes are supposed
to fill with all ones/zeroes. The modes are simply all the possible logic
operations on two binary numbers.

> What is the real chance of someone not noticing the lack of

It has happened to me. ;-)

>are more than likely going to appear in a section of code dealing with

You can get quite far without remembering to include the correct files.
Sooner or later the implicit int arguments are going to kill you, though.

This actually happened to me just the other week when I was porting fVDI
to TurboC/PureC. It was even with malloc(), but in this case not the
library variant. I'd forgotten to declare the function in the file that
used it, and PureC happily passed the size of the area to allocate as an
int (16 bit), not knowing that the function would try to interpret it as
a long (32 bit)...

>image decompression. Now why the Cast? Well if you noticed in this
>thread both the original questioner and myself are both using PureC, which
>is just about anything you want to say except a modern compiler ;)

Isn't it at least supposed to be ANSI compatible?

RC4 is a patented stream encryption algorythm which has become
the defacto standard for random number generators. During my
analysis, I discovered that it has a serious (but easily remedied)
flaw.

The normal (8 bit version) has 256(256!) possible states, making
a thorough analysis impossible. But that is not the case with the
2 bit version (96 states) or the 3 bit version (322,560 states).

What I discovered is that the 96 states for the 2 bit version are
organized into 4 separate loops of lengths 49, 41 and two with 3
states each. For the 3 bit version I have found loops of 238874,
40265, 6625, 5533, 4696, 3008, 2406, 1179, 118, 66 and at least
48 separate loops of 7 states each (so far).

By extrapolation, the 8 bit version should also be subject to short
cycles, possibly as short as 255 states. Needless to say, almost
all keys will produce one of the longer cycles (especially if one
is much longer than all the others), but some will produce cycles
shorter than the code length.

Since the RC4 algorythm otherwise has good performance in terms of
chi-squared tests and auto-correlation, and the odds of hitting one
of the short cycles is so small, the best fix is simply to store
the initial state and detect when it is hit a second time, then
make a random change (such as running the key through it again).

Sorry, I don't know much about ST yet, so I can't help you with the code,
but I'm interested in using Pascal-ish languages with it. Where can I get
an Object-GEM compiler? Also, does anyone know of some freeware/abandonware
Pascal compilers? My favorite language is Modula-3, but I think it'd be a
bit bloated to run on an ST :)
Thanks,
-dan

Xref: supernews.google.com comp.sys.atari.st:8329 comp.sys.atari.programmer:310

Hello,

I would be very interested in these 3 books (I understand they are [the only?] 3 volumes of a set). They have been out of print forever, and I have had no luck in searching for them in the used book arena. I would really rather do this as a set, as it would save me on shipping costs.

Compute's Technical Reference Guide - Atari ST, Vol 1: The VDI
" " Vol 2: GEM/AES
" " Vol 3: TOS

Now what I'd like to do is this: I will pay shipping both ways, as well as a reasonable fee for your trouble (say, 5-10 dollars for the set, less individually). These books are long out of print and I want the information contained in them, for a little ST programming site I am doing. I will ship them back to you after a week. Obviously there's quite a bit of trust required for this, and I will give you plenty of personal information accordingly. Again, I'd prefer to do this "rental" as a set, but please mail me anyhow if you only have 1 or 2 of them, because I may in the end resort to renting them individually.

Thanks,
-dan

Hi!

John Kormylo <elfsoft@mindspring.com> wrote:
> RC4 is a patented stream encryption algorythm which has become
> the defacto standard for random number generators.

Well, the algorithm actually isn't patented, but was classified as a "trade secret" by RSA Inc. You couldn't get the source unless you signed an NDA. That was until 1994, when someone anonymously posted the source code to sci.crypt.

> During my analysis, I discovered that it has a serious (but easily
> remedied) flaw.
> [Description snipped]

Just a question, but why do you post this to comp.sys.atari.programmer, and not to sci.crypt, where it actually belongs to? It's nothing Atari programming specific, I'd say ;)

Furthermore, short cycles in crippled RC4 are well-known. For example, look at

http://www.deja.com/=dnc/[ST_rn=ps]/getdoc.xp?AN=668939837

or

http://www.burtleburtle.net/bob/rand/isaac.html

That doesn't mean I don't appreciate/value your efforts, but you could've done some research whether it is a known problem yourself, couldn't you? ;)

Ciao

Thomas

Hi Dan,

I have always liked the structured approach that Niklaus Wirth (sp?)
and his team put into languages like Pascal and Modula,2,3.

I used to have Modula-2 for the ST but both the primary and
back-up discs failed !

I think it is available from a number of web sites now.

Object GEM is a series of libraries that can be used with
Pure Pascal from Application Systems. ObjectGEM was written by
Thomas Much and is freeware, though I am sure I will make
a donation if I can ever make it do anything.

Hi!

I'm trying to implement some of my own gemdos system calls. I use TraPatch to hook into the Gemdos trap. From within the trap calls I try to call STinG to connect to a server. But this doesn't seem to behave as expected. When calling TCP_open, it gives a positive answer even though the server isn't up and running. I suspect this could be because the cpu is in supervisor mode while executing the trap, but I'm pretty sure I've heard that the latest version of STinG (v1.26) should work alright in supervisor mode too.

When the server (which is just a simple program running under Linux), is active it reports that the client (my falcon030) has connected. But the falcon (calling TCP_info in a loop to find out when the TCP-state TESTABLISH is reached) never understands that it has a working connection.

Is there something that I have forgot, or something that needs to be patched to make this work?

Regards
Henrik

*** post for free via your newsreader at post.newsfeeds.com ***

i want to code a routine to change the Falcon's resolution to True Color
Mode in a VGA monitor. I'm doig in assembler and using the XBIOS call
"Vsetmode".
But i don't know why whatever resolution i set whit this call, always the
screen moves and behaves like when you try to watch a RGB demo in a VGA
monitor.

I think it's a problem of my VGA monitor, because i also have the same problems with programs like "Whip!" that should work on VGA monitors and it doesn't in mine.
Any idea why doesn't work this call?
May be not all VGA monitors work fine with Videl chip?

But i also think that many demos work fine in my hardware when i load them from 640x400 16 colours and they change to True Color Mode by them self.

What kind of method they use to change between resolutions?

Thanks in advanced.

little question...

I'm reading compendium about appl_read() and i
don't understand...The author say that we must
use evnt_mesag() or evnt_multi() instead, so,
is appl_read() should be used if we received a
length message greater than 16 bytes (send by
appl_write()) ?

Hello !

a new C library GSlib01 in now available.
GSlib01 = GemScript library patch level 01

GSlib is a windom extension (http://windom.free.fr).

The GSlib package contains the lib compiled for sozobonx c and
pure c, the sources, some examples, and the GEMSCRIPT specification

version 1.20 translated in english by Peter West.

You can get GSlib from the windom web site
http://windom.free.fr

or from my perso web site
http://perso.wanadoo.fr/arnaud.bercegeay/load_e.htm

Regards,

Hi!

Is'nt it crazy? Other people sell their Atari stuff - I bought 6
books, and now will start to program the GEM! Funny, aeh?

Yes - I use no Atari, but STonX which now starts to get active again.

http://sourceforge.net/projects/stonx/

Get STonX 0.6.7.3 which now (still beta) provides an interface for
MiNT to the Linux ext2 Filesystem, which it is running on.

I did own an Atari years ago and am now happy to see all the old stuff
again and better new stuff for it. Things I never thought an Atari
would be able to run them.

Martin

Hello !

I like to write a software which takes a program from the serial
line (or midi line). this taken program than should be executed without
any file I/o operations. currently I only found Pexec which takes a
filename
as parameter.

does anybody have any ideas ?

That is quite correct.
evnt_mesag and evnt_multi(... MU_MESAG ...)
return in msgbuf[2] the number of bytes in excess of 16

You can then read these byte by issuing a single appl_read on the ap_id that
was returned by the evnt_... calls in msgbuf[1]

ATARI Profibuch (freely):

```
evnt_mesag(msgbuf);
...
if (msgbuf[2] > 0)
     appl_read(msgbuf[1], msgbuf[2], large_enough_buffer);
```

So if you want to write private messages to a other app, the first 3 shorts must
still be standard.

Hi (again!)

> I like to write a software which takes a program from the serial
> line (or midi line). this taken program than should be executed without
> any file I/o operations. currently I only found Pexec which takes a
> filename
> as parameter.

Well Pexec is exactly what you need:
(From: ATARI Profibuch)
LONG Pexec(WORD mode, const char *file, const char *cmdlin, const char
*env);
mode:
0 = load and go
3 = load, don't go
4 = just go (This is the one you need: LONG Pexec(4, 0L, BASEPAGE *basepage,
0L);)
5 = create BASEPAGE
6 = just go, then free (gemdos >= 0.15)
7 = create basepage, respecting prgflags (gemdos >= 0.19)

To be honest with you: I have never used these functions. I usualy relocate
the program my self and then start it.

The next question from you will be: how do I create a basepage?
Well try to get some documentation. As you are german (I think) I can highly recommend:
Atari Profibuch
by:
Jankowski, Rabich, Reschke; Sybex verlag
It knows (almost) everything there is to know about the OS.

I am not sure whether there is any good documentation on line available...

Hi!

Sorry, if this is new to me, but all other folks know it - just flame
me, but:

On this site I found an probably older Version of GEMDOS for the Atari
as Open Source:

http://deltasoft.fife.wa.us/cpm/archive/unofficial/

This is the License:

http://deltasoft.fife.wa.us/cpm/archive/unofficial/lisence.html

.. and this THE important part of it:

GRANT. Caldera grants you a non-exclusive license to use the Software in source
code form free of charge for personal, non-commercial use. The Software in
source code form may also be used for commercial development purposes, provided
a license is obtained from Caldera before any products or derivative works are
shipped for commercial gain that utilize the Software , its components or
derivative works.
For the source code license grant, you may:
* use the Software on any
single computer;
* use the Software on a network, provided that each
person accessing the Software through the network agrees to the
terms and conditions of this license
* use the Software on as many computers as
needed provided that each person accessing the Software agrees to the terms
and conditions of this license;
* redistribute the Software for
non-commerical purposes, provided any copy must contain all of the original
Software's proprietary notices, marks and license terms. (Note: redistibution of
derivative products for commercial gain is permitted, provided a
license is obtained before the derivative products are exchanged
for commercial gain)
* copy the Software for archival purposes, provided any copy must contain all
of the original Software's proprietary notices, marks and license terms.
* modify, translate, compile, disassemble, or create derivative works based on
the Software provided that such modifications are for non-commercial use and
that such modifications are provided back to Caldera except for those who
have obtained the right from Caldera in writing to retain such
modifications; any modification, translation, compilation, disassembly or
derivative work used for commercial gain requires a seperate license from

Caldera;
You may not:
* permit other individuals to use the Software except under the terms
listed
above;
* copy the Software other than as specified above;
* rent,
lease, grant a security interest in, or otherwise transfer rights to
the
Software; or
* remove any proprietary notices , licenses or labels on the
Software.

Frank, what do you think? Is this the base for an emulator BIOS?

Petr, could this also be a base for some people, who think of
recreating GEMDOS for x86 architecture?

I had a short look at it and found no XBIOS. Is this made by ATARI
themselfes?

Martin

Hi Everybody

I'm new in developing programs for AtariST.
I'l try to build a monolithik multitasking system and one of
my very first steps (now) are to play with the vbl interrupt.

what I have done so far:

1. an assembly procedure to register my c - functionpointer which
   should be executed

2. an assembly procedure which should be called from an interrupt
   which itself jsr to the previous registered C function and
   after them makes a RTE.
   I save and restore all registers with movem.l d0-d7/a0-a6, -(sp)

this behavior works well till my first call to i.e. printf. if my
user defined interrupt c function calls printf I will get a bus error
within the RTE statement.

what's wrong. should I switch between supervisor and user mode ?

are there any examples for how to call user defined C-functions from
interrupts ?

many thanks

Hi all,

I am trying to set up the Atari ST(e), programming in C, so that I can set one of the system timers, then have the timer interrupt and call a function when the time is up.

Is this possible and can anybody help with information on the timers and necessary functions.

I am fairly competent C programmer in GEM, but I dont know how to access interrupts in general, or the timer. Ihave tech notes which give the timer control registers addresses etc, but no information on what values these expect or how the timers behave, or how to set a function to be called by an interrupt.

Many Thanks,
Neil

What time resolution do you want? What kind off application will it be?

Eevrything is possible on a ST!

Well if you are expert in GEM you should look at vex_timv() (VDI 118) no
doubt it will cleanly do all timer work you want. If you on the other side
want total control do something like this (parts of a game I have written).

```
------------------8<-------------------------------------------
/* save old registers, note program is in supervisor mode */
  old_iea=*(byte*)0xfffffa07UL;
  old_ieb=*(byte*)0xfffffa09UL;
  old_ima=*(byte*)0xfffffa13UL;
  old_imb=*(byte*)0xfffffa15UL;
  old_eoim=*(byte*)0xfffffa17UL;
  old_tdc=*(byte*)0xfffffa1dUL;
  old_tdd=*(byte*)0xfffffa25UL;

  old_vbl=*(void **)0x70;
  old_timer_d=*(void**)0110;

  move_sr(0x2700); /* disable all interrupts, own function */

/* init registers */
  *(void**)0x70=vbl_code;
  *(void**)0x110=timer_d_code;

  *(byte*)0xfffffa07UL=0;
  *(byte*)0xfffffa09UL=0x50; /* keyboard and timer d intterupt needed */
  *(byte*)0xfffffa13UL=0;    /* interrupt mask */
  *(byte*)0xfffffa15UL=0x50; /* keyboard and timer d intterupt needed */
  *(byte*)0xfffffa17UL=game.old_eoim&0xf0;
  *(byte*)0xfffffa1dUL=7;    /* timer d control */
  *(byte*)0xfffffa25UL=246;  /* timer d data */
  move_sr(0x2300);
```

```
/* rest of the program */
...

/* restore registers */
  move_sr(0x2700);
  {
    byte *p=(byte *)0xfffffa00UL;
    p[0x0b]=0;
    p[0x0d]=0;
    p[0x0f]=0;
    p[0x11]=0;
    p[0x07]=old_iea;
    p[0x09]=old_ieb;
    p[0x17]=old_eoim;
    p[0x13]=old_ima;
    p[0x15]=old_imb;
    p[0x1d]=old_tdc;
    p[0x25]=old_tdd;
  }
  *(void **)0x70=game.old_vbl;
  *(void **)0x110=game.old_timer_d;
  move_sr(0x2300);
```

```
*************************************
assembly

vbl_code:
     subq.w    #1,game+vbl_count ; decrement vbl counter
     rte                         ; done

; register usage
;
; D0 = work
;
; A0 = game
; A1 = $ffff8800
; A2 = $ffff8802
; A3 = play data

timer_d_code:
     movem.l   d0/a0-a3,-(sp)    ; save registers
     move      #$2300,sr         ; enable interrupts (esp keyboard)
     move.l    #game,a0          ; game struct
...
     movem.l   (sp)+,d0/a0-a3    ; restore registers
     rte
--------------------->8--------------------------
```

When you want to know more about the MFP registers lookup the Hardware Register Listing at www.saint.atari.org (atari docs, hardware guide). Normally you only want to program timer D, leving all other bit the same.

I hope this helps a bit,

Cu, Hans

after many retries I think I know the problem. I gemdos is not
reetrant then I shouldn't call gemdos in interrupt functions.
if I do bios calls instead than all goes right

> length message greater than 16 bytes (send by
> appl_write()) ?

I haven't used appl_read in quite a while, but here is what I can
recall...

Your program has a normal event loop. Once you receive a message event,
check that the third word of the message. If it is non-zero, this is the
length of the message beyond the standard eight words. (in this case
"word" refers to a "16 bit signed integer") You use appl_read() to
retrieve these words.

A sample piece of code (I've left out the normal scaffolding):

```
#include "0/types.h"    // "sint16", "uint16" etc

#include <aes.h>    // GEM prototypes
```

```
sint16 ap_id;    // AES process ID
sint16 msg[24];    // longer message buffer than normal !!
sint16 ev;        // event type
uint16 quit;    // quit flag
OBJECT *menubar;    // pointer to menubar

int main( void )
{
    ap_id = appl_init();
    rsrc_load( "a.rsc" );
    rsrc_gaddr( R_TREE, MENU, &menubar );
    menu_bar( menubar, 1 );
    while( !quit )  {
        ev = evnt_multi( MU_MESAG|MU_TIMER, ... );
        if( ev & MU_TIMER )  {
            quit = 1;
        }
        if( ev & MU_MESAG )  {
            switch( msg[0] )  {
                case MSG_CODE:    // custom over-length message
                    if( msg[2] )    // read excess bytes into rest of
msg buffer
                        appl_read( ap_id, msg[2], &msg[8] );
                    do_something();
                    break;
                case DIE:    // custom 8 word message
                    quit =1;
                    break;
                case MN_SELECTED:    // standard AES message
                    mn_selected( msg );
                    break;
            }
        }
    }
    menu_bar( menubar, 0 );
    rsrc_free();
    appl_exit();
}
```

Hi,

I changed my music system from C-Lab Atari Falcon MK X to PC! So far so
good, but can I use anyway my old atari formated Iomega jaz 1GB discs to
make them read in the PC system (win 2000). The audio format is not the
problem, but the "system format". Are there any emulator programms? Please
help!
Thank you, Mathieu.

Thanks Hans,

I am looking for time resolution of > the 200 Hz timer, 1mS would
be fantastic.

It is for a Midi application, currently I poll the 200 Hz timer,
then compare with my (next event time), send out MIDI if time is
OK, then prepare for the next events, but onviously this runs
into problems when there is too much other stuff eg user altering
values in real time so the timer is polled too late and timing
goes astray.

> What time resolution do you want? What kind off application
will it be?
>
> Eevrything is possible on a ST!

I believe so!

I am not expert in GEM - just about competent. I have very poor
manuals and information so your links should help, thank you.

> Well if you are expert in GEM you should look at vex_timv()
(VDI 118) no
> doubt it will cleanly do all timer work you want. If you on the
other side
> want total control do something like this (parts of a game I
have written).

I dont have this function referenced in my docs?

Thanks for your help,

Cheers,
Neil

Hi all,

I've uploaded STonX 0.6.7.3 on Source Forge and I was
trying to compile it on a latest x86 Debian Linux distribution.
And I have some problems. It fails at "configure" and "make"
passes, because the SVGALib doesn't seem to be installed.
I'm not root on the system, so I can't install any
package, unless on my home directory. I tried to
find "vga.h" "vgakeyboard.h" and all those other stuff
on the system, but there's none of them (they are
included in the "svga.c" source file). Is there a
manner to configure without SVGALib, or installing
SVGALib package, keeping in mind that I'm not root ?

Thanks for help,

Regards,

Hi

What's the easiet way to test for Magic? I thought about TOS version
as Magic always gives 2.00 for 2.0X machines, 3.00 for 3.0x machines
and so on. I can't find the way to get the version though. Are there
any easier or better ways to identify this?

Thanks.

Lyndon Amsdon

>make them read in the PC system (win 2000).

The 'format' you mention is a low level device thing and is non platform

specific, what is important is the partitioning scheme you used.

One way to find out for sure is to try it. If it fails and you still have
the bird handy you could copy all the contents off the Jazz and re-
partiton it to a PC compatible scheme and then copy everything back.
Long and involved but it'l work.

Probably what you need to do is modify the configure.in file,
install autoconf on your machine if it is not yet installed,
and re-create the configure script. Commenting out all lines
containing 'svga' could probably do the trick. Note, however,
that the comment in configure.in is 'dnl'. (Je sais, ça ne
s'invente pas !!!).

Thanks for your reply. Meanwhile I downloaded the devel SVGALibs
and I simply copy it to the STonX-0.6.7.3 directory. Then "configure"
and "make" did work. This makefile builds two version of STonX :
"stonx" and "stonvga". On my Linux box, SVGALib are not installed,
so "stonvga" doesn't work properly. But what works is the standard
"stonx", and that's all what I want. I'm wondering what is the
interest of "stonvga", that can't work with me, but that is well
built. Does "stonvga" allows better resolutions ? Am I missing
something ?

That's nice of you to have replied,

Regards,

See you,

You could check for the magic cookie 'MagX'.

Alternativley, fake a call that you know is magic-specific and act on the
return code.

stonvga gives you more the feeling to really sit in front of an ST,

because there is nothing other on your desktop. Apart from that it
just maps Atari memory into the Linux Framebuffer (which can also be
done on X11 with the shared memory extension of X11). Some people try
to build an X11 based VDI, which works natively. This then would be
much faster, than an emulated one.
Me myself do more like the native work - fVDI e.g., which also works
on X11 as on SVGAlib. In the end it does not matter. X11 may be better
for developers. You can have the emulator on the left, end you IDE on
the right.

Yes, you can use the X11 Interface, which works just fine. For running
an SVGAlib program you need to be root.

For X11 just write

make stonx

anyway, I can *run* stonvga, but the mouse does not work, and
I do not know how to *exit* from stonvga. (apart from physically
turning the damn PC off, that is).

I absolutely need to patch a GFA basic program which I have lost sources.
What is the best way to identify the point to intercept the flow and add a
patch ? Is it possible to disassemble it easily in asm code I can directly
recompile modifyed ? Something working in MagiCMac possibly, where I use my
own LatticeC, PureC and Devpac.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Lattice C doesn't include much info about the cookie jar, only machine
type and a couple of others. I could test if magxboot.prg is prg or
prx but I know this is the worst possible way to test if it is in
memory.

I'm trying to think of some Magic calls....

Thanks

Lyndon Amsdon

Just add this to a relevant header file...

```
#ifndef MiNT_COOKIE
#define MagX_COOKIE 0x4D616758L
#define MiNT_COOKIE 0x4D694E54L
#endif
```

If it's a GEM application you're writing, then testing for "its" cookie
is probably the most elegant solution.

Later,
Karlos.

So utilise that info and look for "MagX"

>I could test if magxboot.prg is prg or prx but I know this is the worst

That would fail on my machine as i use magxbo32, dead end here.

>I'm trying to think of some Magic calls....

Here doggie!!

Start with the cookie jar dude.

Hi, Laurent!

To leave STonVGA you just have to press <F12>. Then you should get
back your commandline.

SVGAlib always needs to be configured in

/etc/vga/<don't know exactly>

There you have to set your mouse. Mine is PS2. Also - if your card is
not directly supported - please set "VESA mode" hard.

Martin

Reading the cookie jar in C isn't that hard. Here a snip from a program I
wrote. Just replace the standard cookies with the ones you want to check
for.

```
  { /* detect machine type */
    long *jar=*(long**)0x5a0;
    if(jar!=NULL)
    {
      printf("Cookie Jar found!\n");
      while(*jar!=0)
      {
        if(*jar=='_MCH')
        {
          game.machine=(int)((jar[1])>>16);
          printf("Machine type: %i\n", game.machine);
        }
        if(*jar=='_SND')
        {
          game.sound=(int)(jar[1]);
          printf("Sound hardware: %i\n", game.sound);
        }
        jar+=2;
      }
```

```
    }
    else
    {
      printf("No cookie Jar found!\n");
    }
    game.sversion=Sversion();
    printf("GEMDOS version: %X\n", game.sversion);
  }
```

Bye, Hans Wessels

It is always possible to look into the cookie jar, unless
the jar is not set up, in which case *(long*)0x5a0 is null.
However you will perhaps not find the relevant info in the
jar if the program/feature you're looking for has not
been installed/run yet.

You must know if the code you want to change is part of a switch statement.
Use ALT+f to find indirect jumps, these can be switch statements.
If so, resolve the relevant switch statements by finding out how long the table of displacement values is, then mark it as jump table. (select, and press <j>).
This way you get labels to the relevant switch parts.
If you have these labels, it is possible to insert new instructions.

Dont change the data and bss segments. Put new variables at the end.

I need help!

Is anybody have some instructions, manual etc... about
how I can work with RSC from GFA Basic 3.6TT (I mean, when I make new
RSC how can I join command to the appropriate button, or input box,
etc...?).

I really don't untestand the PRINCIPLE of working RSC anf GFA Basic; all
advices, instructions, tips and tricks arre more then welcome!!!!

With best regards to all group members,
Drazen

You can try the GFA pages at my URL below, there are no
specific RSC examples but you might find a GFA listing that
might help.

I think there is some confusion here about what a RSC file is. Probably brought about by someone at microsoft not really understanding what NeXT was doing with their programming enviroment.

Basically you have to through alot of Visual Basic ideas out if you want to work with the atari and RSC files. You can do it yourself, but that's exactly it you have to do it yourself. RSC files are a way to make a standard interface to a program that can easily be translated into different languages. The Resource Construction Set concerns itself with nothing more than the appearance and construction of the RSC.

If you want a specific button to do something with a RSC file you have to code your program to do that. You load and init the RSC file. Get the index pointers to the objects and watch the event calls to see if the user is clicking on the specific button, if they are you run the code.

With C there were some people working on the idea of a system where you directly linked routines to buttons etc. But this isn't how a majority of people do the work.

I was sure there is a program that works with GFA to make it easier to
build a RSC file for a GFA program. Can't remember what the name of the
program is. In fact, I may have a copy of it somewhere. I will look...

The STe/TT/Falcon have handy XBIOS routines for
outputing samples via the D2A using DMA, but the
ST with its Yamaha chip doesnt. However, Ive heard
quite a few games output samples. How do they do
this - does anyone know of any source code examples?

Cheers. Ian.

I just released a new version of my XBIOS Random() replacement
(TT030 and Falcon only).

I increased the "seed" in NVM from 4 bytes to 24 bytes. I update
this value each reboot using RSA public key encryption:

x = (x * x * x) mod pq

Also, every installation gets a different RSA key (pq).

The idea is that even if someone reads the value in NVM off your computer, they can't work backwards to determine what values Random() was likely to have produced in previous sessions (or the current one).

Since even true random quantities available to computers typically produce only a couple of bits of randomness, the only way to really improve on this method would be to increase the size of the "seed," and that is limited by the available space in NVM. (I suppose I could keep the seed on disk, but I like finally having a good use for NVM.)

BTW, if primes p and q are chosen so that (p-1)/2 and (q-1)/2 are also prime (strong primes), then the number of x values before repetition is ((p-1)/2 - 1)((q-1)/2 - 1) or approximately pq/4. Also, x cannot be 0, 1, or any multiple of p or q.

Face Value. You simply create the interface in an RSC editor and Face
Value writes the program for you! After that all you have to do is to put
in your own routines, algorithms etc. to ge a fully working program.

It is just as easy as Visual Basic on pc. You hardly have to know
anything about eventdriven programming with a gui with windows, buttons,
etc, etc.

I only have version 1 but it was already a very good tool for fast
programming. It is still under development but now only in German(?)

There are some demos of its capabililty available for download on the Net.

Yes that is the program and I know I have it somewhere. It was a freebee
when I ordered from a US Atari retailer....

Hallo Atari friends.

My name is Herald Witte.
A view weeks ago I recived from an friend and old Atari Portfolio HPC-006,
he had it stored in a shoobox and wasn't using it anymore so he gave it to
me.
I am verry pleased with it, but have one problem the documentation is gone,
and the mini RS232 cable to print and to connetc to the pc.
Is there any way to get the documentation of this product??

Product specifications:

Atari Portfolio HPC-006
16 bit personal computer
DIP Operating System 2.11 v1.072
Copyright (C) DIP 1989

> this - does anyone know of any source code examples?

Playing a sample on a ST is quit a processortime consuming process. This is how it works:

A timer interrupt is used to call a special routine for playing the sample. This means to play a sample at 16 kHz the interrupt routine is called at a frequency of 16 kHz.

To play a byte of the sample the interrupt routine has to do something like this:

```
  get the pointer to the byte of the sample to be played
  get the byte to be played
  add one to the pointer of the byte to be played
  store the pointer to the byte to be played
  use the byte to be played as index to a special sample table
  copy 12 bytes from the sample table to the soundchip
```

in assembly it would look something like this:

```
sample_rout:
  move.l   a0,-(sp)
  move.w   d0,-(sp)          ; save 2 registers
  move.l   sample_p,a0       ; sample pointer
  clr.w    d0
  move.b   (a0)+,d0          ; get byte to be played
  move.l   a0,sample_p       ; store sample pointer
  lea      sample_table,a0   ; special sample table
  lsl.w    #4,d0             ; offset in table
  add.w    d0,a0             ; soundchip data
  move.l   (a0)+,$ffff8800.w ; copy bytes to soundchip
  move.l   (a0)+,$ffff8800.w ; copy bytes to soundchip
  move.l   (a0)+,$ffff8800.w ; copy bytes to soundchip
  move.w   (sp)+,d0
  move.l   (sp)+,a0
  rte

DATA
```

```
sample_table:
  dc.b ....... * a 4096 byte sample table *

TEXT
sample_p:
  ds.l     1
```

I just typed in the code. It has never seen an assembler so I can't guarantee it wil work or even compile.

The sample table contains data for the volume registers of the three voices of the soundchip. The netto effect is (about) the right analouge value for the byte to be played at the soundchip's output.

How to get as sample table? Hard one...

<couldn't find one on the web>

Well, flame me, here is one.

I am not 100% sure whether it is for signed or unsigned samples. From the looks of it I would say unsigned samples.

Succes, Hans

You may want to try out this site. It is suppose to have alot of Atari
manuals on it:

http://www.atariworld.com/tech_info/manuals.html

Thanks :)
Yes, this can be the right solution :)
It's so simply ;))

I'll write tomorrow about the result :))

Two days ago I ordered 10 pieces of paper money from 10 different countries from a company called Perth Numismatics. Lo and behold they arrived today and they are very nice and colourful. They even have a bill from Antarctica. I didn't even know they existed. These are perfect for stocking stuffers or people who are hard to buy for. The website address is www.perthmoney.com
Good luck and Merry Christmas

Hi, I've been coding on the PC (demos) for the past 3-4 years starting with
pascal, then C/C++ and then on to ASM, I now want to move to doing the same
sort of thing on my Atari ST. Can anyone lend a guiding hand to getting
started, and anywhere I can download a good compiler for C/C++/ASM.

Hi!
How can I check the MiNT and MagiC version using the value
of MiNT/MagX cookie?

TURN SIX DOLLARS INTO SIX THOUSAND QUICK AND EASY Guarenteed

READING THIS MESSAGE WILL CHANGE UR LIFE FOREVER

: I found this on a bulletin board and decided to try it. A little
: while back, I was browsing through newsgroups, just like you are now,
: and came across an article similar to this that said you could make
: thousands of dollars within weeks with only an initial investment of
: $6.00! So I thought, "Yeah right, this must be a scam", but
: like most of us, I was curious, so I kept reading. Anyway, it said
: that you send $1.00 to each of the 6 names and address stated in the
: article. You then place your own name and address in the bottom of
: the list at #6, and post the article in at least 200 newsgroups.
: (There are thousands) No catch, that was it. So after thinking it
: over, and talking to a few people first, I thought about trying it. I
: figured: "what have I got to lose except 6 stamps and $6.00,
: right?" Then I invested the measly $6.00. Well GUESS WHAT!?...
: within 7 days, I started getting money in the mail! I was shocked! I
: figured it would end soon, but the money just kept coming in. In my
: first week, I made about $25.00. By the end of the second week I had
: made a total of over $1,000.00! In the third week I had over
: $10,000.00 and it's still growing. This is now my fourth week and I
: have made a total of just over $42,000.00 and it's still coming in
: rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more
: than that on the lottery!! Let me tell you how this works and most
: importantly, WHY it works... Also, make sure you print a copy of this
: article NOW, so you can get the information off of it as you need it.
: I promise you that if you follow the directions exactly, that you
: will start making more money than you thought possible by doing
: something so easy!

: Suggestion: Read this entire message carefully! (print it out or
: download it.) Follow the simple directions and watch the money come
: in!

: It's easy. It's legal. And, your investment is only $6.00 (Plus
: postage)

: IMPORTANT: This is not a rip-off; it is not indecent; it is not
: illegal; and it is 99% no risk - it really works!

: If all of the following instructions are adhered to, you will receive
: extraordinary dividends.

: PLEASE NOTE:
: Please follow these directions EXACTLY, and $50,000 or more can be
: yours in 20 to 60 days. This program remains successful because of
: the honesty and integrity of the participants. Please continue its
: success by carefully adhering to the instructions.

: You will now become part of the Mail Order business. In this business
: your product is not solid and tangible, it's a service. You are in
: the business of developing Mailing Lists. Many large corporations are
: happy to pay big bucks for quality lists. However, the money made
: from the mailing lists is secondary to the income which is made from
: people like you and me asking to be included in that list.

: Here are the 4 easy steps to success:

: STEP 1: Get 6 separate pieces of paper and write the following on
: each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now
: get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of

: paper so the bill will not be seen through the envelope (to prevent
: thievery). Next, place one paper in each of the 6 envelopes and seal
: them. You should now have 6 sealed envelopes, each with a piece of
: paper stating the above phrase, your name and address, and a $1.00
: bill. What you are doing is creating a service. THIS IS ABSOLUTELY
: LEGAL! You are requesting a legitimate service and you are paying for
: it! Like most of us I was a little skeptical and a little worried
: about the legal aspects of it all. So I checked it out with the U.S.
: Post Office (1-800-725-2161) and they confirmed that it is indeed
: legal. Mail the 6 envelopes to the following addresses:

: #1)Jeff Brookman
: 3415 Covered Bridge Ln.
: Charlotte, NC 28210

: #2)Wit Wichaidit
: 10912 Broad Green Terrace
: Potomac, MD 20854

: #3)Mike Schude
: 893 S. roanoke
: Gilbert, AZ 85296

: #4)David Freeman
: 11045 Harbour Springs Circle
: Boca Raton, Fl 33428

: #5)Kevin Kniceley
: 4029 Minard Rd. N.W.
: Dover, OH 44622

: #6)John Decowski

: 51 Walnut Hill Rd
: Derry, NH 03038

: STEP 2: Now take the #1 name off the list that you see above, move
: the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR
: Name as number 6 on the list.

: STEP 3: Change anything you need to, but try to keep this article as
: close to original as possible. Now, post your amended article to at
: least 200 newsgroups. (I think there are close to 24,000 groups) All
: you need is 200, but remember, the more you post, the more money you
: make! You won't get very much unless you post like crazy. :)

: This is perfectly legal! If you have any doubts, refer to Title 18
: Sec. 1302 & 1341 of the Postal lottery laws.
: Keep a copy of these steps for yourself and, whenever you need money,
: you can use it again, and again.

: PLEASE REMEMBER that this program remains successful because of the
: honesty and integrity of the participants and by their carefully
: adhering to the directions. Look at it this way. If you are of
: integrity, the program will continue and the money that so many
: others have received will come your way.

: NOTE: You may want to retain every name and address sent to you,
: either on a computer or hard copy and keep the notes people send you.
: This VERIFIES that you are truly providing a service. (Also, it might
: be a good idea to wrap the $1 bill in dark paper to reduce the risk
: of mail theft.)

: So, as each post is downloaded and the directions carefully followed,
: six members will be reimbursed for their participation as a List
: Developer with one dollar each. Your name will move up the list
: geometrically so that when your name reaches the #1 position you will
: be receiving thousands of dollars in CASH!!! What an opportunity for
: only $6.00 ($1.00 for each of the first six people listed above) Send
: it now, add your own name to the list and you're in business!

: ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS----------

: Step 1) You do not need to re-type this entire letter to do your own
: posting. Simply put your cursor at the beginning of this letter and
: drag your cursor to the bottom of this document, and select 'copy'
: from the edit menu. This will copy the entire letter into the
: computer's memory.
: Step 2) Open a blank 'notepad' file and place your cursor at the top
: of the blank page. From the 'edit' menu select 'paste'. This will
: paste a copy of the letter into notepad so that you can add your name
: to the list. Step 3) Save your new notepad file as a .txt file. If
: you want to do your postings in different settings, you'll always
: have this file to go back to.
: Step 4) Use Netscape or Internet explorer and try searching for
: various newsgroups (on-line forums, message boards, chat sites,
: discussions.)
: Step 5) Visit these message boards and post this article as a new
: message by highlighting the text of this letter and selecting paste
: from the edit menu. Fill in the Subject, this will be the header that
: everyone sees as they scroll through the list of postings in a
: particular group, click the post message button. You're done with
: your first one! Congratulations...THAT'S IT! All you have to do is
: jump to different newsgroups and post away, after you get the hang of
: it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE
: MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU
: HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving
: money from around the world within days! You may eventually want to
: rent a P.O.Box due to the large amount of mail you will receive. If
: you wish to stay anonymous, you can invent a name to use, as long as
: the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE
: CORRECT.**

r. Now,
: each of the 5 persons who just sent me $1.00 make the MINIMUM 200
: postings, each with my name at #5 and only 5 persons respond to each
: of the original 5, that is another $25.00 for me, now those 25 each
: make 200 MINIMUM posts with my name at #4 and only 5 replies each, I
: will bring in an additional $125.00! Now, those 125 persons turn
: around and post the MINIMUM 200 with my name at #3 and only receive 5
: replies each, I will make an additional $625.00! OK, now here is the
: fun part, each of those 625 persons post a MINIMUM 200 letters with
: my name at #2 and they each only receive 5 replies, that just made me
: $3,125.00!!! Those 3,125 persons will all deliver this message to 200

: newsgroups with my name at #1 and if still 5 persons per 200
: newsgroups react I will receive $15,625,00! With an original
: investment of only $6.00! AMAZING! When your name is no longer on the
: list, you just take the latest posting in the newsgroups, and send
: out another $6.00 to names on the list, putting your name at number 6
: again. And start posting again. The thing to remember is: do you
: realize that thousands of people all over the world are joining the
: internet and reading these articles everyday?, JUST LIKE YOU are
: now!! So, can you afford $6.00 and see if it really works?? I think
: so... People have said, "what if the plan is played out and no
: one sends you the money? So what! What are the chances of that
: happening when there are tons of new honest users and new honest
: people who are joining the internet and newsgroups everyday and are
: willing to give it a try? Estimates are at 20,000 to 50,000 new
: users, every day, with thousands of those joining the actual
: internet. Remember, play FAIRLY and HONESTLY and this will really:
work.

May be you can try the Sozobon C compiler ... it seems it can work
without hard disk.

Hi,

I'd liked to thank everyone who helped me on the clink problem, that's
sorted and now I'm getting the feel of Lattice. Also my problem with
the argument reader is over, I'm now using arc from unix libary.

Anyway, now my next problem. I have a file opened with fdopen and in
that file are ascii characters. I have a file that has contents like:
Name=1234
Password=5678
And I need to take the variables and write them into another
file. So the text from the source file is changed and written
into another file like this:
N=1234
Pword=5678

I'm finding this section quite difficult, the only possible solution I
can see is using unix function "stcpm" or "stcpma"

Is there any other functions I could be using?

Lyndon Amsdon

I seem to be having a problem with calling the GDOS function
vqt_devinfo, while looking for the available GDOS printers.

According to my docs, you pass it a VDI handle, device number, pointer
to an "exists" flag, and a pointer to a string. It will then return a
YES/NO in the exists flag, and the driver name in the string.

However, this does not seem to work properly when I iterate through the
GDOS printer device numbers. Even if a device number has been assigned
to a driver, and they're correct in the ASSIGN.SYS file, I still get a
zero in the exists flag, meaning the device doesn't exist.

The only way I can seem to make it work is to open the device
workstation first. This can be a pain - especially if one of the printer
device numbers happens to be an ACSI device and isn't connect, or is
switched off. This will hang my TT for about 14 seconds inside the
v_opnwk() call.

I've checked that I have a sufficient GDOS (I need Font, FSM or
SpeedoGDOS for the function) - I am using SpeedoGDOS 4.1.

Anyway, here is what my code looks like:

```
if( gdos_version < 0x200 )  {        // Original bitmap GDOS?
```

```
    for( a = 21; a <= 30; a++ )  {    // iterate through printer device
nums
        work_in[0] = a;                     // set device num to loop
var
        v_opnwk( work_in, &handle, work_out );    // try to open device
        if( handle )  {        // non-zero handle = OK
            printer_list[counter++] = a;    // add device num to
successful list
            v_clswk( handle );            // close device
        }
    }

    }
else  {        // otherwise Font, SM, Speedo GDOS
    for( a = 21; a <= 30; a++ )  {        // iterate through printer
device nums
        // if I add a v_opnwk() line here, vqt_devinfo works, otherwise
it doesn't

        vqt_devinfo( vdihandle, a, &exist, driver );    // get device
info
        if( exist )    // does it exist?
            printer_list[counter++] = a;    // add to list
    }
}
```

try making the driver resident in the assign.sys file, using a line
something like this ...

21r printer.sys

could I also (modestly) point out that my ttf-gdos supports
vqt_devinfo(). It's at ftp://chapelie.rma.ac.be/atari/

you may also find that fontgdos is slightly buggy in this area, and
doesn't set the return values (at all). I suggest that before you
call vqt_devinfo() you set

```
     intout[0] = 0;  /* only set if driver is found */
     contrl[2] = 1;  /* nr words in ptsout[] */
     contrl[4] = 11; /* len filename */
```

good luck, I hope this helps

As you'll appreciate, a box-standard 520ST is going to be limited on
what it'll run - unless it has a hard disk, which opens things up
somewhat.

Let us know. Also - is it ST,ST(e) etc?

Use "standard" functions where you can. In this case 'strchr' and
'malloc' will do the job (along with strlen,strcat,free). I've used
C++ (//) comments here 'cos I'm being lazy - the code I've written is
C though. :-)

```
#include <appropriate headers> //I dont use Lattice
//string.h stdlib.h mem.h

// think about this function at a later date
// well worth understanding though
// (ie how come 'void' can be dereferenced?)
// clue: it can't
static void
memkill(void **p)
{
 if (!*p)   return;

 free(*p);
 *p = NULL;
}

// 'static' means "keep this function hidden
// in this source file". If you had another
// "static ChangeToken()" in another file they
// wouldn't see each other and everything would
// work fine (two independant functions).
static char*
ChangeToken(const char s[], const char n[])
{const char *   p;
 char       *   ss;

 if (NULL == (p = strchr(s,'')))   return NULL;

 p = &p[1];
 ss = malloc(strlen(n) + 1 + strlen(p) + 1);
 if (!s)    return NULL;

 strcpy(ss,n);
 strcat(ss,"=");
 strcat(ss,p);

 return ss;
}
// why (NULL== ...) ?
// Consider...
// if (s == NULL) ...
// and if you mistyped it...
```

```
// if (s = NULL)
// <G>

// hack together some 'strings'...
int
main()
{char   *   old_lines[] ={
                "Name=1234",
                "Password=5678"
            }
 ;
 char   *   new_lines[2]    ={NULL,NULL}; /*(1)*/

 new_lines[0] = ChangeToken(old_lines[0],"N");
 new_lines[1] = ChangeToken(old_lines[1],"Pword");

 if (new_lines[0] && new_lines[1])
    printf("[%s][%s]\n",new_lines[0],new_lines[1])
 ;

 memkill(&new_lines[0]);
 memkill(&new_lines[1]);

 return 0;
}
```

(1) Figured out 'memkill' yet?

I'll elaborate on anything you can't figure out.

Have Fun!

Hi,

Is there something like Atari Compendium only for Milan?
Basicly I'm looking for list with description of all functions (in C)
available for Milan 040/060.

Hi Rafal

No compendium that I know of, but try asking Frank Naumann or Michael
Schwingen, they know a lot about Milan and programming.

Thanks a lot :)
But Milan GmbH should make something like this, that would be very usefull
for programmers.

Yesterday I was working on my Atari 1040 STf with Borland Turbo C v2.0, on a program that reads a picture file from disc and shows it on the screen, but I have noticed that sometimes it jumps over a byte in the file, and don't read it. So the picture on the screen is smaller and looks corrupted. I don't know how to fix this problem. I am running the program with 250kB ramdisk, but I still have around 300kb free memory. Reading the picture with gfa basic, stad, arabesque or any other program is correct.

I guess it will be a lot easier to analyze your problem if you'd post
your code ...

Ciao

Hi Damir!

DK>Yesterday I was working on my Atari 1040 STf with Borland Turbo C
DK>v2.0, on a program that reads a picture file from disc and shows it on
DK>the screen, but I have noticed that sometimes it jumps over a byte in
DK>the file, and don't read it.
How do you read the picture? Do you use GEMDOS or standard C functions?
If you use the C functions, did you open the file in binary mode?

Bye

Joerg

http://www.atarigames.net/apps.htm

This Site has GFA Basic v3.5e, Lattice C v3.04, PCDitto v3.64 (MS-DOS emulator for the ST), Emulators, and TOS Files.

If You still need something else (like an Assembler) I have a disk with full GFA Assembler, Basic 3.5, and Raytrace I can image (it's an old ST Format).

Nevermind, I turned back to Gfa Basic. It is smaller and lot faster
(although I don't know if it's better). And it's working, what is most
important.
Thanks for help.

Hi,

I have a problem. I'm trying to make some graphics and I have some
problems with NOVA card and Afterburner on Falcon (ofcourse) :(
How should I use vro_cpyfm for NOVA card? How can I recognize that NOVA
is installed?
What about Afterburner? Is it in 100% compatible to F030 ? (for example
VsetRGB).
Or where can I find answers on my questions?

Marry Christmas for all

vro_cpyfm works just the same on the Videl and Nova. It's no necessary to
do anything Nova-specific unless you want to bypass the VDI and modify the
bitmaps directly.

> What about Afterburner? Is it in 100% compatible to F030 ? (for example
> VsetRGB).

The Afterburner doesn't do any changes to the VDI, so it's 100% compatible
with a 030-Falcon.

Cross-posted from CIX atari.st/5questions

TITLE: Hard drives and adapters

Can anyone tell me for which Atari computers the IDE conversion is
available? I believe it is for STes, but will it work with ordinary STs
and Mega St and/or STes? CHRIS????

Also, what does ATAPI stand for and what types of devices does it
cover? Is it a protocol like SCSI or IDE, or more/less than that? In
an earlier posting (Oct 98) Uwe Seimet said that in effect and greatly
simplified these are SCSI devices connected to the IDE bus and that
most devices other than hard disks conected to the IDE bus are ATAPI
devices. Besides CD-ROMs, what are we talking about? Streamers, MOs or
even scanners?

Regards, /Peter/

Get the source of STonX or take the source of WinSton (now Stew):

The StonX Homepage.
http://www.complang.tuwien.ac.at/nino/stonx.html

BUT, the sources from SUSE (as .rpm) are a bit changed and partitially
better! There is also a DOS Version of STonX (also with sources).

I don't know, where I got the Winston sources from, but I can send it
to you, if you (as me) can't find them (in the new year, when I'm back
mail me directly).

If you are interested, how 68000 emulators are done, have a look at
the great papers from

http://www.squish.net/generator/

This is about a SEGA Genesis emulator, which emulates a 68000 CPU and
the atari soundchip.

Martin

And I would highly recommend against this. If you want your software to run on video cards, don't mess around with the memory directly. What you will discover is that a small speed gain on one card will break it for several other cards (some from the same manufacturer).

Mario did an IDE conversion for the Atari computer line. Not sure which
ones apply, but you can check it out at:

Hi!

One question... ;)
Is it possible to make the mouse cursor bigger then 16x16? (32x32 for
example).
If yes, then how?

BTW. Happy new year 2001 :)))

I've never seen a legal system call to do that. Probably
is not possible thru system calls.

>Please, I would be grateful if you could send it to me.

First off, you need to identify the existance of MagiC via the cookie
jar. The jar "starts" here...

```
#define  SYS_P_COOKIES ((LONG*)0x5a0)
```

...and you need to be in supervisor mode to access it. The cookie for
which you are searching is...

```
#define  MAGX_COOKIE_ID    0x4d616758L
```

...and cookies are stored in an array of structures declared in a
manner similar to this...

```
typedef struct    {
ulong    c_id,         /* cookie id */
     c_up;         /* cookie user pointer */
}    COOKIE;
```

If there is no cookie jar then (*SYS_P_COOKIES) will be NULL. Where at least one entry exists then the end of the array is denoted by member 'c_id' being set NULL.

Assuming you are already in supervisor state then...

```
int
find_cookie(COOKIE *cp)
{COOKIE  *c   =(COOKIE*)(*SYS_P_COOKIES);
 int i    =-1;

 while (c && c[++i].c_id)   {
     if (c[i].c_id == cp->c_id)  return i;
 }

 return -1;
}
```

...will return the array index of the desired cookie, or -1 if it doesn't exist. 'cp' is a pointer to the (COOKIE) for which you want to search. EG:

```
COOKIE   c    ={MAGX_COOKIE_ID,irrelevant};
int  x;

//enter superstate
x = find_cookie(&c);
if (x >= 0)   {
     c = ((COOKIE*)(*SYS_P_COOKIES))[x];
}
//back to userstate
```

At this point 'x' will be zero or greater if the cookie exists (ie some version of MagiC does exist) and less than zero if MagiC isn't there at all. Where MagiC does exist 'c' will contain the contents of its cookie. From this point on we are interested in 'c_up' - the "user pointer". The meaning of 'c_up' is dependant of whatever it is you are looking for. In the case of MagiC, it points to one of these structures...

```
typedef struct     {
long     config_status;
DOSVARS  *    dosvars;
AESVARS  *    aesvars;
}    MAGX_COOKIE;
```

...and it is 'aesvars' which contains the desired information: the 'release' and 'version' members of the (AESVARS) structure is what you're after.

Loosely...

```
MAGX_COOKIE   *mc  =NULL;
```

```
COOKIE        c    ={MAGX_COOKIE_ID,irrelevant};
int      x;
uint32        r;

//enter superstate
x = find_cookie(&c);
if (x >= 0)   {
     c = ((COOKIE*)(*SYS_P_COOKIES))[x];
     mc =(MAGX_COOKIE*)&c;
}
//back to userstate

if (!mc) return no_magx_status;

r = mc->aesvars->release;
r <<= 16;
r |= mc->aesvars->version;

return r;//hi-word=release, lo-word=version
```

The only <magx.h> header file I can find is for version two. I can email it if you want but please note I had to add stuff to it from the manual as the file hadn't been ammended to reflect changes mentioned in the manual.

I don't think it would increase the size above 16x16, but in case you are interested there used to be a Mouse Ka Mania PD program available that could substitute various cursors for the Atari one, or allow you to make your own.

Happy New Year to you too! (Lay off too much of the Slivovic!)

Hi!

I've tried installing GCC 2.8.1 from Christian Felsch's homepage. I followed the instructions for installing under TOSFS very closely, and it works. Almost.
I can make gcc compile a normal c-file, but when I try compiling a c++-file, I get some strange errors, like these:

E:/PROGRAMM.ING/GCC/INCLUDE/G++/streambuf.h:394: warning: invalid type 'void *' for default argument to 'ios *'

and

linking: c.a
./cc6200001.o: Undefined symbol _cout referenced from text
./cc6200001.o: Undefined symbol ostream::operator<<(const char *)
referenced from text

I think it's strange that I get error messages on the include files that comes with the package. I suspect that I've missed some settings of GCC, but I can't find anything else in the installation instructions. I've made sure that GNUEXEC, GNUINC, GNULIB, and GXXINC are in the environment. And besides, I don't think it's because of that, because GCC does find the include files.

Any suggestions?
Regards
Henrik

Have you forgotten to invoke gcc with g++ here? Remember to use g++
instead of gcc if you want to link C++ programs.

Ciao

Thomas

Ooops! That's what I had forgotten... It works now with g++.
Strange that it doesn't say anything about that in the documentation
though. But I guess that a certain IQ is assumed... ;-)

I still get that first "invalid type" error message though, but it did
work when I tried to compile a small "hello world" program. Unfortunately
the final executable was rather large: 102KB...

At least the IQ to read the man page supplied with gcc ;)

```
-- snip --
     DESCRIPTION
          The C and C++ compilers are integrated.  Both process input
          files through one or more of four stages: preprocessing,
          compilation, assembly, and linking.  Source filename
          suffixes identify the source language, but which name you
          use for the compiler governs default assumptions:

          gcc  assumes preprocessed (.i) files are C and assumes C
               style linking.

          g++  assumes preprocessed (.i) files are C++ and assumes C++
               style linking.
-- snap --
```

Or does Christian's packed not include this?

> I still get that first "invalid type" error message though, but it did
> work when I tried to compile a small "hello world" program.

It wasn't an error, but a warning. Shouldn't normally happen with system
includes, but if everything works, I wouldn't worry.

> Unfortunately the final executable was rather large: 102KB...

Did you strip it?

Ciao

Thomas

Hi again!

Now that gcc works reasonably well under TOSFS on my falcon, I'd like to
make it work under MagicPC too. I installed it in exactly the same way as
described in Christian's documentation, but when I try to run either gcc
or g++, it doesn't get very far. All I see are the four or five first
lines of gcc's output when using the -v option. I compared it to when
running on my falcon, and gcc (or g++) stops just before it says something
about "m68K MIT syntax". I don't know what the program is doing then, but
it's the same everytime.

I can't figure out what the difference there could be between my falcon
and the pc, because all gcc is supposed to do is read a file and write an
output file...

Anyone out there who has succeeded in running gcc 2.8.1c under MagicPC
6.1 and Jinnee 2.01?

Could it be something about the filesystem used? (it's FAT32 under MagicPC
too, I suppose, since windoze98 uses that).

Regards
Henrik

Do you use gcc on a container drive or an existing windows folder? Try
using a container drive, as the XFS MagiC PC uses to access windows
folders has some bugs / problems, which may well be the cause of your
difficulties.

Ciao

Thomas

I assume that container drive means that a drive under MagicPC is mapped
to a folder under windoze98, right? The C:\ under MagicPC is actually
c:\program\magic_pc\magic_c\ under windoze, and I've only tried using the
container drive c:\. I have also mapped (windoze) C:\ as D:\ under
MagicPC, to get access to the rest of the harddrive, but haven't tried
compiling from that drive yet. I'll give it a shot then. Hopefully it'll
work.

No, exactly the other way around: What you mean is what I've called a
folder drive.

A container drive is actually a large file inside the PC's directories
which MagiC PC accesses as it were a Atari harddisk partition. And I
assume your problems would disappear if you'd use gcc on such a drive,
instead of a mapped windows folder.

Ciao

Ok, now I get it.

> A container drive is actually a large file inside the PC's directories
> which MagiC PC accesses as it were a Atari harddisk partition. And I
> assume your problems would disappear if you'd use gcc on such a drive,
> instead of a mapped windows folder.

Well, I just tried running gcc from a 32MB container drive (making sure
the GNUEXEC and the other environment variables point to the correct
locations), but unfortunately it didn't make any difference. It stops at
the same place. Sometimes it says ***SYSTEM ÜBERSCHRIEBEN*** also, which I
assume is caused by the bug(s) in the file routines of MagicPC. So there's
not much do to about it then, until the bugs are fixed. :-(

I would like to thank you Thomas for your time and patience.

Regards
Henrik

Hi!

I'm trying to make a program that will provide my own type of network
filesystem
functions (I don't mean NFS for mint) under TOS. I figured that I would
have some sort of file server, which I will have to code too, on a pc or
another atari, and map a new drive to GEMDOS. What I'm wondering is: Is
there an easy way to map this drive to gemdos, and make gemdos call my own
routines when Fopen and other functions are called, or will I have to hack
GEMDOS in some way?

I've already prepared myself for the event that I would have to hack
gemdos instead. I've managed to replace the Trap vector ($84) with my own.
Until now all my routine does is jumping through the old vector, but I
have verified that it works, by for example switching the background color
of the screen before jumping through the vector. This gives an annoying
flickering screen when opening files and so on. :-)

I've also tried detecting what kind of GEMDOS call was made before jumping
through the old vector, but this has failed totally. If I'm not mistaken
(and according to the 68030 manual from motorola) the stack frame
generated by a trap call is 8 bytes in total (sr (Word), pc (Long), vector
number (Word)). And the last thing that is put on the stack before the
trap
call should be the GEMDOS function number, so that when my own GEMDOS

vector is entered all I have to do is retreive a word from 8(sp), to get
the function number. For example if I want to make the screen flicker when
someone calls Cconws the following should do just that:

```
myGEMDOS:
     cmp.w    #CCONWS_FUNCTION,8(sp)      did they call Cconws?
     bne.s    jump_through_old       nope, do nothing special

     bsr  flicker_screen              yes, flicker screen
jump_through_old:
     move.l   oldGEMDOS,a0
     jmp  (a0)              let the old GEMDOS do its
                            stuff
```

I've tried varying the offset (8 in the above example), but my routine
never detects a Cconws call. Is there something about the trap handling
that I don't know?

Note that this last part about hacking GEMDOS is really not necessary to
solve if there is a simple solution to my first problem (look in the
beginning of this post).

Regards
Henrik

Actually, it is usually retrieved from 0(USP). For total compliance,

you should check the status word at 6(sp) to see if you were in user
or supervisor mode when the trap occured, then do either a LEA 8(sp),A0
or MOVEA.L USP,A0 to get the arguments.

I think MetaDos provides just this. However, I do not know where to find
documentation on how to write a MetaDos driver - Julian Reschke schould know
this.

>I've also tried detecting what kind of GEMDOS call was made before jumping

Watch out: the offset is 6 for 68000 and 8 for 68010 and newer. You can used the system-variable _longframe ($59E IIRC) to detect this - if it is non-zero, the offset is 8.

```
>    cmp.w    #CCONWS_FUNCTION,8(sp)      did they call Cconws?
>    bne.s    jump_through_old       nope, do nothing special
```

You have to check if the parameters are on the user or the super stack (check the bit in the saved PSW in the stack frame).

IIRC, on the user stack, the offset is constant, while on the super stack, it is 6 or 8 depending on CPU.

You might consider using TraPatch - that's a little freeware TSR that handles hooking into system vectors for multiple programs, which means it is (a) more efficient if multiple programs hook into the same vector, and (b) you don't have to worry about these details.

If you hook into GemDos, you have one more problem to solve: you need filehandles that you know Gemdos will never return - and that don't collide with MetaDos and similar programs, either.

Hi Henrik!

GH>What I'm wondering is: Is there an easy way to map this drive to
GH>gemdos, and make gemdos call my own routines when Fopen and other
GH>functions are called, or will I have to hack GEMDOS in some way?
AFAIK you can do this by a MiNT device driver, but not in normal TOS (at
least I don't know how ;-))

GH>I've already prepared myself for the event that I would have to hack
GH>gemdos instead. I've managed to replace the Trap vector ($84) with my
GH>own. Until now all my routine does is jumping through the old vector,
[...]
GH>I've also tried detecting what kind of GEMDOS call was made before
GH>jumping through the old vector, but this has failed totally.
Have a look at my TraPatch.
It allows you to hook into any BIOS, XBIOS, GEMDOS, AES and VDI function.
And as your code receives a pointer to the parameters in a register, you
don't have to find them yourself dealing with stack frame sizes and the
callers mode (and stack).
An additional benefit is that your code doesn't slow down the calls you're
not interested in

Bye

Joerg

That would be ST Computer of Germany. Unfortunately, it lost news stand
distribution a year ago.

As far as I know, ST Applications is still being published.

I however hear about another paper-based Atari magazine..... ;)

If the rez is say 640x480 it moves it to x:656, y:512 or something
close to that. Just off the bottom right somewhere. I made
some tests which dumped the coordinates from the move msg.
Someone may find that interesting to know. :-)

His problem is not so much where it puts it, but is there a legal
way to move the window back to the visible area? Take for example
an icq msg appears whilst the window is hidden and there is an option
to make the window pop back on screen. However from my tests
if you move the window yourself it seems to confuse either the AES
itself Thing, and/or Taskbar in my tests as I don't know how it works
beyond the move msg. It places an "*" next to the hidden apps, but
if you move it yourself then these marks become messed up.
If that helps...

>
Well Curt, I think that the idea of using Mac/65
might be the smoothest way to get the Atari to
recognize the new programming.

However writing the device driver on a PC
using a good assembler/disassembler will create
a driver that will recognize most equipment that
actually is based on a 16/32 bit structure of today.

The data crunching will bring about the headaches
when you try to make either a 16 bit device or a
32 bit device work on an 8 bit computer system.

You don't need to hack the O.S. to add a device driver. If the device is SIO or ram based, just write the driver code, using the entry points detailed in many Atari advanced programming texts. The driver loads into ram and adds its name to the driver name list. "De Re Atari" is a good place to start. "Mapping the Atari" is the book to have. Note that PBI devices get a little more complicated, usually needed a eprom for the code.

Also note that Atari 8 bit questions are best posted at comp.sys.atari.8bit.

If you are talking about the graphical parts AES and VDI then oVDIsis and oAESis do run on PowerPC, but if you are also talking about GEMDOS, BIOS and XBIOS then I am not aware of such an effort. If someone ports the latter then it should be possible to use oVDIsis and oAESis for the graphical parts.

1) Get an emulator. I suggest either PaCifiST, or WinSTon (or one of
its successors, known as STew)
2) Get MAKEDISK. This comes with the full distribution version of
PaCifiST, but is available separately.
3) Use MAKEDISK to read your ST disk images into a .ST image file.
4) Use these image files in one of the emulators.

The Swedish /Atarimagasinet/ has been around for 15 years now. It's a
quarterly magazine and no. 3/2000 just went out to the subscribers.

Subscription/membership fee is SEK 175 adding SEK 50 if outside
Sweden. Check http://www.sak.nu/ for details.

Hi there,

I'm looking for help with Hisoft BASIC...

I've looked on the Hisoft web-site but they don't appear
to support or sell it anymore (I could be wrong!). I've
only got a coverdisc version of v1.23, but never got round
originally to ordering the docs or upgrading via the mag
to v2.

Some of the more curly syntax is starting to test my memory
so what I'm looking for is a doc with a syntax descriptor
for GEM/AES event handling, also more precise instructions on how
to hook into RSC files, and recognise mouse events in relation
to actions on said RSC files...

Is such a thing in existence, or has the boat sailed too long
ago! :^{

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

A guy called Matthew Bacon can supply you with Hisoft BASIC 2
and he also runs a Hisoft BASIC WEB Site. The site is currently
unavailable but will be back online soon:

http://www.cadenza-software.co.uk

If you e-mail Matthew directly, I'm sure he can help you out. :

Actually *original* GEM *is* open source! All Digital Resarch's intellectual
property was acquired by Caldera a few years ago. Original PCDOS GEM was
GPL'd and is available at www.deltasoft.com

Of course, this does not apply to TOS version.

Hi,
a new version of LDG (version 2.00) is avalaible at

http://ldg.atari.org/

LDG is a TOS based system allowing GEM applications to
load and share dynamical libraries. This last version is
really faster than previous one (version 1.20).

The package provides a GEM installer and a developper kit
for Gcc, Pure C and Sozobon C. However, it is very simple
to use LDG for other language (as explained in the
ST-guide documentation of LDG).

Have fun

>Also note that Atari 8 bit questions are best posted at comp.sys.atari.8bit.

I disagree. This isn't comp.sys.atari.ST.programmer. It should be shared
by both 16 and 8 bit programmers. After all many ST programmers probably
started with the 8 bits, and probably still have info to share.

Cheers!

James

Yes, but there's (arguably) more 8bit experts in the 8 bit area than
here, non-specific though it is.

I've been doing a bit more work on cleaning up the DLL manager I'm writing.

As part of the process of making it more programmer friendly, and making it more widely used (and usable), I was wondering what features would you like it to have?

It runs as an AUTO folder TSR at system boot time, and consumes about 32k RAM.

At present, it has the following function calls:

Detection of the Toolbox:

An XBIOS function call that returns information about itself.

Library Enumeration:
There are library enumeration functions available (LibFirst, :LibNext) which allow you to get info about all libraries currently loaded, and can be used to implement your own "find library" function.

Library Search:
There is a LibFind function which will look through all currently loaded libraries to find on with a matching name, and return a true/false result, and info about the library, if found.

Library Load/Free:
The Toolbox will load a library given its filename, and return a handle which is used to call functions within the library. If a library is already loaded, it will "link" to it, and return a different handle. To unload a library, simply call the LibFree function (the library will only be fully unloaded when all users of the library have called LibFree)

Library File Info:
Ou can get info about a library file on disc by calling the LibFileInfo function. This will return info such as name, version, toolbox/processor requirements and so forth.

Are there any other features that would be of use that I have omitted?

Have a look at LDG Library... There is everything you need :))

BTW.
Is there any example how to use it?
Something what could I see.

Not at present. I'll be looking at putting it up on a web page shortly.

(Earlier versions are floating about, but are generally incomplete/incompatible)

The interface to the Toolbox is a TRAP based one, mimicking the GEMDOS/BIOS/XBIOS interface, requiring no interface libraries to be linked in to the application (a la GEM AES/VDI calls).

For example, here is a "Hello World" app (written in C and assembler)

```
#include "0/types.h"    // typedefs "sint16" etc
#include "0/tlbx.h"        // toolbox interface/typedefs

#include <stdio.h>

int main( void )
{
    sint16 libhandle;    // library handle, negative = failed to load
    TlbxInfo tinfo;    // info about the toolbox
    LibInfo libinfo;    // info about the library loaded

    if( xtlbxID( sizeof( tinfo ), &tinfo ) != 'tlbx' )  {
        printf( "No Toolbox\n" );
        return -1;
    }

    if( (libhandle = tlbxLibLoad( "libname.tll", sizeof( libinfo ),
libinfo, NULL, 0 )) < 0 )  {
        printf( "Cannot load library\n" );
```

```
        return -2;
    }

    // you could examine the library loaded, and act accordingly here
    // however, we'll just be simple, and assume it's OK if we get a
good handle

    printf( "Hello, %s\n", libWorld(3) );

    tlbxLibFree( libhandle, &libinfo );

    return 0;
}
```

Now the same thing in assembly language:

(I've written this while online, so please excuse any typos/problems
[OE5.5 isn't ideal for entering source code])

```
main:
    link    a6,#-size
    move.l    d7,-(a7)

    pea    tinfo(a6)
    pea    tinfosize.w
    move.w    #'tb',-(a7)
    trap    #14
    cmp.l    #'tlbx',d0
    add.w    #2+4+4,a7
    beq.s    ok

    pea    notlbx
    jsr    printf
    moveq    #-1,d0
    addq.w    #4,a7
    bra    return

ok
    clr.l    -(a7)
    clr.l    -(a7)
    pea    libinfo(a6)
    pea    libinfosize.w
    pea    libname
    move.w    #$14,-(a7)
    clr.w    -(a7)
    moveq    #0,d1
    trap    #0
    tst.w    d0
    add.w    #2+2+4+4+4+4+4,a7
    bge.s    ok2

    pea    noload
```

```
    jsr    printf
    moveq    #-2,d0
    addq.w    #4,a7
    bra    return

ok2
    move.w    d0,d7

    move.w    #3,-(a7)
    move.w    libWorld_funcnum,-(a7)
    move.w    d7,-(a7)
    moveq    #0,d1
    trap    #0
    add.w    #2+2+2,a7
    move.l    d0,-(a7)
    pea    hellostring
    jsr    printf
    addq.w    #4+4,a7

    pea    libinfo(a6)
    move.w    d7,-(a7)
    move.w    #$16,-(a7)
    clr.w    -(a7)
    moveq    #0,d1
    trap    #0
    add.w    #2+2+2+4,a7

    moveq    #0,d0
return
    move.l    (a7)+,d7
    unlk    a6
    rts

notlbx
    dc.b    "No Toolbox",10,0
libname
    dc.b    "libname.tll",0
noload
    dc.b    "Cannot load library",10,0
hellostring
    dc.b    "Hello, %s",10,0
```

Based on some feedback I've got, I may be changing the interface from

```
    push args
    push lib func num
    push lib handle
    move magic into D1 register
    trap    #0
    fix stack
```

into something like this:

```
    push args
```

```
    push lib func num
    push lib handle
    trap    #(3? or 12? or ?)
    fix stack
```

as there no longer appears to be a need for a "magic" number when calling the Toolbox. (It used to be useful in the earlier days, when there were multiple versions of the Toolbox, and many differing ways of passing parameters)

As far as I know, all MFP are clocked with the same frequency:
2 457 600 Hz. It is a constant between Atari machines which have this
chip.

I just bought a 520st and I want to program in BASIC or C. Can someone
recommend a good starting point? I've looked around on the Web and I've
found a lot of advanced information and code libraries, but no compilers or
Basic development tools. And very little info for a programmer new to the
Atari. Any help would be greatly appreciated. Thanks.

Dan Imal

> while testing, there came up some other questions, maybe someone could
> answer:
> - does timer A run continuously when once started?

Timers A and B have event-count mode and delay mode.

The event-count mode triggers the interrupt when an event occurs.
For Timer A, it is end of DMA sound on STE machines
For Timer B, it is end of video line.

The delay mode is the "frequency" mode, where the interrupt triggers
after a programmed time, continuously until stopped.

> - if not, do I have to free the irq? (using xbios $1b, JENABINT etc?)

To do things clean, you should save each Timer state before modifying it.
Then, when you have finished using it, restore previous values.
It is necessary because you do not know which program or system can use
it, even if STE machines do not use Timer A by default.

> - when I use IRQs, do I have to save (and restore) an/dn manually?

In a interrupt routine, you must save all registers you modify, because the
interrupt can triggers anywhen in your program, so if you have a main loop
in your program and you do not save registers in the interrupt, do not ask
yourself why things are going wrong.

Hi everyone,

I'm having a few problems with Clink supplied with Lattice. I'm a new
comer to Lattice let alone C so dont bite me head off!

Now I'm sure this is a very simple answer but I can't figure it out.

I have a piece of code like this to see what has been given to find
the programs command line:

```
#include <stdio.h>
#include <stdlib.h>
#include <aes.h>
char *app,*cm;
main()
{
shel_read(app,cm);
printf("The application name was %a and the command line passed was %b\n",app,cm);
return 0;
}
```

I get an error like this:

```
<<<stuff here>>>>
Undefined symbols        First Referenced
_shel_read               File 'I:\PROGRAM\CODE\COMMAND.O'
<<<<more stuff here>>>
```

That is the programmes main problem. How much of Lattice do I need to
set up, from a fresh installation? It's all rather confusing, but I
really need to know C. The manual doesn't seem to help very well.

TIA.

If the only "undefined symbols" are names of GEM procedures, then it'd be that you're not linking in the GEM libraries. If there are any other names in the list of symbols, then you may not have your linker path set.

I'll assume that it is simply that you're not linking as a GEM app.

If you're using the integrated environment supplied with 5.60 (and 5.52?), look at "Executable" under the "Options" menu. Within that dialog, ensure that the "Build GEM app" option is selected. Then relink the app (select "Link" from the "Project" menu)

However, if you are using the linker from the command line, you'll need to tell it to link a GEM app. Check the manual chapter dealing with the Linker (in volume 1). Sorry, I don't have the manual handy, so cannot be more specific (I think this will be either adding an option to the command line, or naming the GEM library in the list of files to be linked)

Thanks Mario, you've found the problem I've been having with Clink
but.....the program crashes with two bombs! ARRRGGHH!!

So I need yet more help. When the program was compiled with out
linking as a GEM app, I clicked on the default.TTP and the printf
statement was displayed but with the %a and %b, but I suppose this was
because it wasn't using the shel_read command.

Another thing is, the message was displayed twice, not sure why.

Now when it is compiled and linked as a gem app, if I execute
default.prg as a prg (or a ttp for that matter) I get two bombs and
no message.

Anyone help.....please??

No, to print strings you must always use %s :-)

Of the other I know nothing, I dont have Lattice.

Changing %a or %b to %s doesn't seem to have made any changes
unfortunatly. If this helps at all it bombs with 2 bombs with Lattice
C (or possibly Magic) reporting TOS error #69.

Sorry I can't find my error codes...it was somewhere on my HD.... :(

Ok, I had a better look at your example (must do that always :-)
shel_read is a AES call.
You can only do AES calls if you are a .prg and you call appl_init first.

Keep the %s !!

About printf:

It is not a macro, but a real procedure.
%a .... %z are NOT argument numberlike things.

```
%d   16 bit word --> decimal
%ld  32 bit word --> decimal
%s   string
%x   16 bit word --> hex
%lx  32 bit word --> hex
%c   the character in the least significant 8 bits of a 16 bit word
```

to name a few

It could be because the pointers you're passing to shel_read() haven't
been initialised and probably point 0L, which would explain the 2 bombs.

Try replacing the:

```
char *app,*cm;
```

with:

```
char app[128],cm[128];
```

Another thing, you should use appl_init() before calling shel_read() and
appl_exit() before the program quits.

However, if you are running a 32-bit system, then

%d 32 bit fixed-point integer
%hd 16-bit fixed-point integer
(Some 32-bit systems also use "%ld" for 64-bit fixed-point integer)

... and likewise for hexadecimal values.

Some (most?) also use "%x" vs "%X" for lower-case vs upper-case hexadecimal values. (ie decimal value 27 becomes either "1c" or "1C")

```

I've assumed you've trimmed the example code you supplied, however if it is to use a GEM AES/VDI function, you should have called appl_init() previously - and don't forget to call appl_exit() before your program finishes!

%a and %b are not valid format specifiers within printf(). Based on the code you've supplied, you want to display strings, so "%s" would be more appropriate.

```
>
> Another thing is, the message was displayed twice, not sure why.
```

Can't answer this one - I haven't ever seen a need for shel_read in my code. If ever I've needed to recover the command line, I use the argc and argv values passed to main() from the startup code.

```
>
> Now when it is compiled and linked as a gem app, if I execute
> default.prg as a prg (or a ttp for that matter)  I get two bombs and
> no message.
```

No GEM initialisation (via appl_init) ?

Some corrections:

%d is an int
%ld is a long int
%hd is a short int

Same for x instead of d.

IIRC, the ANSI standard does not specify the bit numbers of short, int,

long, etc. The only thing you can be sure of is

short <= int <= long

For example, on a 64 bit machine, a long may have 64 bit, a short 16 and
an int 32.

But because too much code seems to rely on "long == 32 bit", most
compilers stick to that and instead offer a "long long" with > 32 bit
(64 most of the time).

Ciao

Thomas

Hi!

Henk Robbers <H.Robbers@cable.A2000.nl> wrote:
> C'mon, this guy is trying to get a simple program running on his ST.

Yes? And because of that, it's not OK to give precise definitions?

> If I ask somebody the time, do I want an estiamate of the age of the
> universe?

No. But it's simply good programming practice to pay attention to
details like that. Note, for example, that already with Lattice C (what
he's using), %d is /not/ always 16 bit, but an int. Depending on the
compiler settings in Lattice C, this means 16 or 32 bit. It's just Pure
C that only knows of 16 bit ints.

And another example, why assuming something without checking the exact definitions can be harmful: A /lot/ of code out there relies on time_t being a 32 bit value, easily convertible to and from long.

That's true for most of today's systems, but such a time_t isn't able to represent dates beyond 2038-01-19, 4:14:07 a.m. Now some people say: "OK, no problem, let's simply make time_t a 64 bit value". That would be perfectly OK, weren't there so many programs relying on it being a 32 bit value ... Most of them will of course compile with such a new time_t, but will most probably fail at runtime.

Ciao

Thomas

Using a signed 32-bit counter for the seconds since the start of 1970,
it appears to overflow shortly after 2145 million-ish seconds (ie 68.09
years) have elapsed (ie 1970-2037, partway into 2038). This also allows
representation of dates back to near the end of 1901, if my maths is
accurate

I recall there being talk some years ago about it failing when the most
significant bit became a '1' and hence was deemed to be negative. They
were going to redefine it as an unsigned 32 bit value, IIRC.

This would extend the failure/rollover date by another 68 years (to
February 2116, I think), but disallow pre-1970 dates.

Yes. And what's different here to what I've written?

> I recall there being talk some years ago about it failing when the most

That would be a violation of POSIX, as POSIX states errors in calls to
time_t-related funtions are to be represented as (time_t)-1. Thus, if
you made time_t an unsigned 32 bit value, (time_t)-1 would actually be
(time_t)2147483648, a valid date. How'd you want to detect an error now?

Ciao

Sorry - I didn't intend my post to come across as a criticism.

The preceding paragraph was what I was aware of regarding 32-bit time_t.
This would set the background for the following paragraph, where I ask
about them changing from signed to unsigned 32-bit time_t.

It's been a long time since I've needed any of the <time.h> functions
that use time_t, and I'd forgotten about that.

Thank you for correcting me on this point.

I've been reviewing the contents of the archive containing my DLL manager, prior to its eventual release.

Within the archive, I have the Toolbox itself, source code to a Toolbox Loadable Library (TLL), an application that uses the Toolbox to load, use and unload the sample library, a few C header files used by the application and library, and a simple ASCII file containing details of the Toolbox API (how to detect/use the Toolbox and its libraries).

There is also a (fairly primitive) library enumerator accessory, which can also interrogate library files, and configure them. (It hasn't really been touched since about 1996-ish, apart from being recompiled to work with the recent Toolbox revisions)

Are there any other utilities or files I should include in the archive that you would find useful?

(To the person who suggested I look at the LDG library: I have downloaded the archive, and will be looking at it shortly. Hopefully it does not clash with my Toolbox)

Hi,

Is there any fast way to make color sprites in C?
I'm doing this in that way:

1. first I'm showing the background picture
2. I'm saving the square, where the sprite will be shown
3. then I'm showing the mask
4. then the sprite
5. when the mouse position is changed then I'm showing the saved square
and back to 2.

It works good, but the sprite flickers... :(

You can pre-construct an XOR mask to swap back and forth between background and sprite quickly. XOR the background and the sprite, then AND the result with the sprite mask. A ^ (A^B) = B and B ^ (A^B) = A while A ^ 0 = A. This reduces the flicker caused by separate draw steps for background, mask and sprite.

See vro_cpyfm() with wr_mode value S_XOR_D.

If you are really fancy, you can construct an XOR mask to move the sprite in one screen operation.

Well, I'm drawing this ((backround and a mask) XOR sprite) in memory not on the screen.
And it still flickers.
Maybe it woud be faster to draw the mask as a 1 bitplane picture (in fact mask is a 1 bitplane picture).
Will it be faster? or maybe the assembler routine for calling vro_cpyfm would be faster?

Since you already draw it in memory the only thing left to do in my
opinion is to wait for vsync before calling vro_cpyfm to put it to
screen.
Helped in some games I coded although I only needed it in falcon
256 color mode but it has its limits. Since you're wasting time waiting,
you at least have to prepare all sprites in memory to put all of them
out at once.

Hi there,

I'm trying to write a small C program to convert
X-IMG graphics to some format of icon, so that
I can load these icons into programs like the
wonderful ICDRAW 1.42, by Dr.Bob.

The biggest hurdle is finding the spec for the
X-IMG format, which despite an hour or 2 on the
the net I have miserably failed to achieve!

Does anyone know of a site that has a copy of the
X-IMG spec on it? This is all I need to get moving
on this project. The .ICO format spec was easy to
find so that side is a piece of cake...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

Hello There
For some time I have had startup problems on my Falcon 030. When I switch it
on
the Harddisk and the rest of the machine doesn't start. If I press the reset
button for
5-10 seconds the machine normaly starts, but some time I have to switch the
Falcon and
press the reset button a lot of time to get the machine to life.
What's wrong ???

I have had the machine for 6 years now, but it is only the last year this
problem has appear.

Thank, Preben Sloth

I can mail some XIMG docs directly to you apon request.
My address is below.
Posting them here would not be a good idea. ;-)

Hi all

Is there anyone who possesses the true colour driver for the MV 300 Graphics card please. Or have details of where it can be obtained?.

I've had the same problem a few times. Loose socketed chips have been
the suggested culprit, but I haven't opened her up to be sure.

Good luck with your search.

Always seem to be pimping this ;) If you grab the boinkout2 sources from my site there is a set of C routines for reading an (x)img file into an MFDB. While it's not a spec description, it might save you some time.

TURN SIX DOLLARS INTO SIX THOUSAND QUICK AND EASY.

HOW TO TURN SIX DOLLARS INTO SIX THOUSAND:

: READING THIS COULD CHANGE YOUR LIFE! IT DOES WORK!

: I found this on a bulletin board and decided to try it. A little
: while back, I was browsing through newsgroups, just like you are now,
: and came across an article similar to this that said you could make
: thousands of dollars within weeks with only an initial investment of
: $6.00! So I thought, "Yeah right, this must be a scam", but
: like most of us, I was curious, so I kept reading. Anyway, it said
: that you send $1.00 to each of the 6 names and address stated in the
: article. You then place your own name and address in the bottom of
: the list at #6, and post the article in at least 200 newsgroups.
: (There are thousands) No catch, that was it. So after thinking it
: over, and talking to a few people first, I thought about trying it. I
: figured: "what have I got to lose except 6 stamps and $6.00,
: right?" Then I invested the measly $6.00. Well GUESS WHAT!?...
: within 7 days, I started getting money in the mail! I was shocked! I
: figured it would end soon, but the money just kept coming in. In my
: first week, I made about $25.00. By the end of the second week I had
: made a total of over $1,000.00! In the third week I had over
: $10,000.00 and it's still growing. This is now my fourth week and I
: have made a total of just over $42,000.00 and it's still coming in
: rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more
: than that on the lottery!! Let me tell you how this works and most
: importantly, WHY it works... Also, make sure you print a copy of this
: article NOW, so you can get the information off of it as you need it.
: I promise you that if you follow the directions exactly, that you
: will start making more money than you thought possible by doing
: something so easy!

: Suggestion: Read this entire message carefully! (print it out or
: download it.) Follow the simple directions and watch the money come
: in!

: It's easy. It's legal. And, your investment is only $6.00 (Plus
: postage)

: IMPORTANT: This is not a rip-off; it is not indecent; it is not
: illegal; and it is 99% no risk - it really works!

: If all of the following instructions are adhered to, you will receive
: extraordinary dividends.

: PLEASE NOTE:
: Please follow these directions EXACTLY, and $50,000 or more can be
: yours in 20 to 60 days. This program remains successful because of
: the honesty and integrity of the participants. Please continue its
: success by carefully adhering to the instructions.

: You will now become part of the Mail Order business. In this business
: your product is not solid and tangible, it's a service. You are in

: the business of developing Mailing Lists. Many large corporations are
: happy to pay big bucks for quality lists. However, the money made
: from the mailing lists is secondary to the income which is made from
: people like you and me asking to be included in that list.

: Here are the 4 easy steps to success:

: STEP 1: Get 6 separate pieces of paper and write the following on
: each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now
: get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of
: paper so the bill will not be seen through the envelope (to prevent
: thievery). Next, place one paper in each of the 6 envelopes and seal
: them. You should now have 6 sealed envelopes, each with a piece of
: paper stating the above phrase, your name and address, and a $1.00
: bill. What you are doing is creating a service. THIS IS ABSOLUTELY
: LEGAL! You are requesting a legitimate service and you are paying for
: it! Like most of us I was a little skeptical and a little worried
: about the legal aspects of it all. So I checked it out with the U.S.
: Post Office (1-800-725-2161) and they confirmed that it is indeed
: legal. Mail the 6 envelopes to the following addresses:

: #1) Steve Wehvila
: 3155 Vernon St.
: Duluth, MN 55806

: #2) Jeff Brookman
: 3415 Covered Bridge Ln.
: Charlotte, NC 28210

: #3) Wit Wichaidit
: 10912 Broad Green Terrace
: Potomac, MD 20854

: #4) Mike Schude
: 893 S. roanoke
: Gilbert, AZ 85296

: #5) David Freeman
: 11045 Harbour Springs Circle
: Boca Raton, Fl 33428

: #6) Webster Lessard
  254 Clarks Mills Rd.
  Hollis, Maine 04042

: STEP 2: Now take the #1 name off the list that you see above, move
: the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR
: Name as number 6 on the list.

: STEP 3: Change anything you need to, but try to keep this article as
: close to original as possible. Now, post your amended article to at
: least 200 newsgroups. (I think there are close to 24,000 groups) All

: you need is 200, but remember, the more you post, the more money you
: make! You won't get very much unless you post like crazy. :)

: This is perfectly legal! If you have any doubts, refer to Title 18
: Sec. 1302 & 1341 of the Postal lottery laws.
: Keep a copy of these steps for yourself and, whenever you need money,
: you can use it again, and again.

: PLEASE REMEMBER that this program remains successful because of the
: honesty and integrity of the participants and by their carefully
: adhering to the directions. Look at it this way. If you are of
: integrity, the program will continue and the money that so many
: others have received will come your way.

: NOTE: You may want to retain every name and address sent to you,
: either on a computer or hard copy and keep the notes people send you.
: This VERIFIES that you are truly providing a service. (Also, it might
: be a good idea to wrap the $1 bill in dark paper to reduce the risk
: of mail theft.)

: So, as each post is downloaded and the directions carefully followed,
: six members will be reimbursed for their participation as a List
: Developer with one dollar each. Your name will move up the list
: geometrically so that when your name reaches the #1 position you will
: be receiving thousands of dollars in CASH!!! What an opportunity for
: only $6.00 ($1.00 for each of the first six people listed above) Send
: it now, add your own name to the list and you're in business!

: ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS----------

: Step 1) You do not need to re-type this entire letter to do your own
: posting. Simply put your cursor at the beginning of this letter and
: drag your cursor to the bottom of this document, and select 'copy'
: from the edit menu. This will copy the entire letter into the
: computer's memory.
: Step 2) Open a blank 'notepad' file and place your cursor at the top
: of the blank page. From the 'edit' menu select 'paste'. This will
: paste a copy of the letter into notepad so that you can add your name
: to the list. Step 3) Save your new notepad file as a .txt file. If
: you want to do your postings in different settings, you'll always
: have this file to go back to.
: Step 4) Use Netscape or Internet explorer and try searching for
: various newsgroups (on-line forums, message boards, chat sites,
: discussions.)
: Step 5) Visit these message boards and post this article as a new
: message by highlighting the text of this letter and selecting paste
: from the edit menu. Fill in the Subject, this will be the header that
: everyone sees as they scroll through the list of postings in a
: particular group, click the post message button. You're done with
: your first one! Congratulations...THAT'S IT! All you have to do is
: jump to different newsgroups and post away, after you get the hang of
: it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE
: MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU

: HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving
: money from around the world within days! You may eventually want to
: rent a P.O.Box due to the large amount of mail you will receive. If
: you wish to stay anonymous, you can invent a name to use, as long as
: the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE
: CORRECT.**

r. Now,
: each of the 5 persons who just sent me $1.00 make the MINIMUM 200
: postings, each with my name at #5 and only 5 persons respond to each
: of the original 5, that is another $25.00 for me, now those 25 each
: make 200 MINIMUM posts with my name at #4 and only 5 replies each, I
: will bring in an additional $125.00! Now, those 125 persons turn
: around and post the MINIMUM 200 with my name at #3 and only receive 5
: replies each, I will make an additional $625.00! OK, now here is the
: fun part, each of those 625 persons post a MINIMUM 200 letters with
: my name at #2 and they each only receive 5 replies, that just made me
: $3,125.00!!! Those 3,125 persons will all deliver this message to 200
: newsgroups with my name at #1 and if still 5 persons per 200
: newsgroups react I will receive $15,625,00! With an original
: investment of only $6.00! AMAZING! When your name is no longer on the
: list, you just take the latest posting in the newsgroups, and send
: out another $6.00 to names on the list, putting your name at number 6
: again. And start posting again. The thing to remember is: do you
: realize that thousands of people all over the world are joining the
: internet and reading these articles everyday?, JUST LIKE YOU are
: now!! So, can you afford $6.00 and see if it really works?? I think
: so... People have said, "what if the plan is played out and no
: one sends you the money? So what! What are the chances of that
: happening when there are tons of new honest users and new honest
: people who are joining the internet and newsgroups everyday and are
: willing to give it a try? Estimates are at 20,000 to 50,000 new
: users, every day, with thousands of those joining the actual
: internet. Remember, play FAIRLY and HONESTLY and this will really:
work.

The easiest way is to call Vsetmode() (requires v1.1).
Check the online help for parameters.

Hi!

John Kormylo <elfsoft@mindspring.com> wrote:
> The easiest way is to call Vsetmode() (requires v1.1).

IIRC, you can simply use something like this with Pure C 1.0:

```
#define Vsetmode(a)    xbios(dontknowtheopcodeofvsetmode, (a))
```

Or write your own assembler module - not a big deal, IMO.

Ciao

Thomas

OK. Vsetmode should works correctly, but...
Should I make some speciall magic tricks before to use it?
I have also problems using Vsetmode under ScreenBlaster, is there any solution?

Hi,

I have written a piece of code that looks like :

```
JumpFrom:
  jmp ([JumpTable-JumpFrom-4.b,PC,d0.l*4])
JumpTable:
  dc.l Target1,Target2,...

Target1: some code
Target2: some more code
...
```

The advantage is that it doesn't need an extra address register and is faster than any other method I tried. When I assemble it with the Pure Assembler it works very fine but when I assemble it with DevPac 3.10 although I set the option to 68040 and in the DevPac manual it is described to be working from 68020 up I always get :

Error : relative addressing not allowed

I tried every variation I could imagine but it's no use. Unfortunately I need GST format output of that module and therefore can't use the Pure Assembler.

So can anybody tell me how to write that code so DevPac accepts it or is there a bug in DevPac preventing the use of PC relative addressing modes ?

Thanks
Gerhard

First: Pasm doesnt assemble this exemple correctly.
I was made aware of the fact by Ronald Andersson when he used TTDigger.
Being a Pasm user, I made the same mistake in TTdigger.

This may the reason why you did the subtraction yourself
because
```
     jmp  ([b,pc,d0.l*4])
```
should be good enough (if Pasm wasnt wrong! :-)

Basicly Pasm says: OK if you want to do my work (the subtraction), I dont mind.

Second: Your subtraction could be the reason why Devpac complains.
Nobody seems to be perfect.

There are 2 solutions:
use Pasm and write
```
     jmp  ([4,pc,d0.l*4])
```
or
use Devpac and write
```
     jmp  ([b,pc,d0.l*4])
```

PS the last public version of TTD (6.1) still has the error.
I have version 6.2 that fixes this, but couldnt be published because of
a related, not yet solved, problem.

Hi,

I would like to add some device drivers into the Atari 8bit OS, can anyone recommend a good assembler/disassmbler for the PC or is it better that I just use something like Mac/65 on the 8bit itself, save it as a file and burn it to an eprom???

I appreciate the help, thanks.

Curt

The first thing that strikes me here is that your offset calculation has
a trailing ".b", which Devpac thinks means "byte". This '020+ addressing
mode only allows word and longword offsets.

Also, why don't you use "jmp ([JumpTable,pc,d0.l*4])" ?

AFAICR, it is analagous to
```
    lea    JumpTable(pc,d0.l*4),a0
    jmp    (a0)
```

I haven't used that addressing mode very often in the 8-odd years I've
owned a TT

Hi!

I've e-mailed the maintainer of WinSTon, offering to help with MIDI support for Windows, but never got a response. So I'm posting here to see if anyone wants my help or knows where I can offer to support Winston, and I'm also posting to ask for anyone who knows about the Atari ST side of things MIDI-wise (because I only know about programming MIDI under Windows, hardware and software (ie, which port is to beemulated)..

Hope that's clear enough!

Jeremy.

Hi Jeremy

Thanks for your OFFER and I hope someone listens as this is DEARLY NEEDED to be able to run Atari Midi Apps on a PC (under emulation of course) There are some Atari-Midi apps that cannot be reproduced for Windows like Dr T's KSC Omega II with PVG.

I am just Encouraging you and anybody here that does Atari Emulation for PC, that this is a need.

BTW...for the Mac platform, I am happy to report that NoSTalgia DOES work for Midi. You really have to "tweak it" though.Harry Koopman (Of Midijoy) has tested it for us on Atari-Midi Egrp.

Tim

NoSTalgia supports Midi via Quicktime (Midi OUT) or OMS (Midi IN & OUT)
but some applications are not (yet) working.
Note that the current version of NoSTalgia (0.7) has a bug preventing
Midi apps to run.
Version 0.71 is planned next week.

Enjoy !

Agreed.

(BTW: "analogous" means "similar to", not "the same as")

Register A0 would not be referenced, used or altered in my suggested
alternative. I simply used a "load address, jump indirect" to show the
mindset behind my alternative. Perhaps if I'd used a blatantly illegal
register in my example (like R0 or A8) then there wouldn't have been

this mis-understanding

A lot of us would love this, but as the midi timing even on native PC
programs is appalling I can't imagine what it would be like on an emulator
sat on top of windows.

Get real!
Most studios around the world actually DON'T use Ataris, believe it or not.
You don't have sample accurate sync on an Atari - but with a real midi
interface on a PC you have it there - so nowadays, a PC is even better for
midi applications than an Atari machine...
The main reason for midi timing problems is when people try to use crappy
gaming soundcards for midi - and that's impossible to use other than as a
toy! This is not a general problem in the PC, but a problem within the
soundcard!

You're right. The code didn't look like that at my first try but
since it didn't work I altered it until Pasm did what I wanted it to
do, thinking it had somehow been my fault although I couldn't
understand why.
So many thanks, there's absolutely no chance I would ever have found
out what really caused the troubles.

Gerhard

Hi folks,
I need someone to make a small alteration to a old unsupported item of
software (STOS 3D).
Basically this software has some preset values for a certain function and I
want these removed from the main body of the program and placed in/read from
a text file so that users can alter them for each project they write by
simply changing the contents for the file.
The file contents will be 15 set of 3 numbers.
I will check this group over the next few days for any responces but if you
would like to help please e-mail me directly.

Thanks,
Stephen Moss

guess I need to upgrade my £200 toy soundcard for a proper one then (sigh)
I suppose then I can ignore the latency control on my £300 sequencer that I
run on my £1200 PC.

I find this very interesting. I know gas, Pasm and DevPac and
every one of the three wants this a bit different. DevPac seems
to be the only one of them that does the subtraction without me
writing it there. But anyway it works fine that way. Thanks !

Well, it's a good alternative to

```
  lea JumpTable,An
  jmp ([An,Dn.l*4])
```

except when you have enough registers and can leave An unchanged
for several times looping over the jmp.

I admit one shouldn't use these modes if there is a slight
chance that the program would work on a ST too otherwise, but
the program I'm working on runs at ~5% of the needed speed on
an unenhanced Falcon so it makes no sense trying to run it on
an ST :(

Gerhard

I would suggest you to use a midi interface that's separated from the
soundcard itself - either an USB- or serial port-interface. Otherwise, it

probably won't give you the performance you're after, due to the internal handling in the soundcard. All combined cards I know of have the audio as the main priority, so midi always comes last... As for audio latency - how about my RME Hammerfall's 1.5ms...? ;) My midi interface is a rack unit from Opcode that connects to the serial port. I never have even the smallest glitch or problem with midi or audio - just the superb sample-accurate sync I want :)

Hmmm. Pasm does the subtraction, the problem is it takes the wrong pc value.
2 bytes short of the correct value.

In the manual it says "PC is the address of the extension word"
question was: which one?. :-)

Whilst I am not bad as assembly coding, STOS is a real pain as it is
compiled and really hard to follow so I suspect you will not get any takers.

Thanks, but I already know about it, besides it's STOS 3D I want to mess
about with not STOS the Games Creator, I have tried tracking down the
authors of the 3D extension but nobody knows what happend to them or the
source code.
I have managed to disassemble it into source code, the problem is that I
don't understand it, never could get the hang machine code.

Hi,

just wondering which is the most powerful between the Falcon and TT
since they are both based on the same processor.

cheers,
Marc

The TT has a 32-bit bus and a double-clocked CPU, so in this respect it's
a lot more powerful than a Falcon. The Falcon has much better graphics and
16-bit stereo DMA-sound though.

Not to forget its DSP, which enables the Falcon to do things the TT
won't manage, like playing MP3s at a decent speed. Of course, you need
special software that supports the DSP.

Ciao

Thomas

Hi there,

Marc Wilson wrote:
>
> Hi,

> since they are both based on the same processor.

Thats where the similarity ends...

A standard Falcon clocks its 68030 CPU at 16MHz, while a standard TT clocks in at 32MHz. The TT also has faster RAM access, due to wider (full 32-bit) access to memory. The Falcon system bus only uses I think 24-bits of the full 32-bits bus to access memory. Even if the Falcon CPU was clocked at 32MHz (mine is), the TT will still run ordinary software faster due to its memory access advantages.

If you use the DSP in the Falcon however the table turns somewhat. As an example I've timed depacking of JPEG image files on an STe, Falcon, and TT. The Falcon depacker used its DSP and was about 50 times faster than the STe, and several times faster than the TT.

Other aspects draw comparison too, with the TT losing out on
graphics and sound capability to the Falcon.

Both are still good machines, but the overall feel of speed would go
to the TT I believe, with the Falcon winning on graphic and audio
stuff...provided of course you are talking 'standard' machines, as
both can be upgraded significantly!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi,

Recently I have been wondering if there is a way to unhide windows that
has been previously hidden by the AES? (Any more AES than NAES support
WINHIDE?)

I guess it is possible to just move the window back into the desktop
area, but that will confuse the AES from what others told me. Now, is
there any way to do this with AES calls?

/Joakim

from what i know, GEM is not open source.
you'd be as well to legally reverse-engineer it and write a spec, get
someone else or more people (for legal reasons) to write something
compatible and similar to GEM but modify it for the PowerPC's different
RISC architecture.

Hi,

anyone know any published (i.e. paper not electronic) Atari mags that
are still being published? last I saw of ST Format was about 2 or 3
years ago.

bye,
Marc

I am not a prgrammer, but ISTR that the problem is that it isn't
documented where MagiC moves the windows to.

It's not the emulator that is slow, it's your ST. The ST is simply too
slow to emulate most computers. All other Oric emulators (Amoric,
Euphoric) require also systems much more powerful than a plain ST.

Atoric already uses an optimized CPU core (Assembler language) but it
seems that the 68000 is more suitable to emulate the Z80 (Spectrum,
ZX81).

It seems strange that it would be better at the Z80 than the 6502.

I've seen other emulators work on the ST so is the Oric a problem, or is it
just the ST ?

I'm not an expert on CPUs. Maybe the way the Z80 works is more similar
to the 68000. But I've talked with Christian a few times - he uses the
6502 core of the C64 emulator programmed by Uwe Seimet.
There's always room for optimizations but hardly enough to run at full
speed.

>

There are about four emulators which work quite nicely even on a plain
ST: Zx_Sp, ZX81, QLem and 2nd Life. All of them (except QLem) emulate a
Z80 machine.
XFormer was the only 6502 emulator which was quite fast on a ST. But
this emulator was very limited.

The problem is the ST IMO but the Milan is quite a nice Oric clone :-)
(runs at full speed there).

Hi All,

Looking through the Atari bargins at Hisoft (www.hisoft.co.uk)
I see they are selling copies of Personal Pascal at only 10 UK Pounds.

It's been many years since I used Pascal and I was just wondering
if anybody out there uses it, or has any opinions of it?

So, is it any good?

Thanks.

Bye,

Ben Hills.

Hi

Im currently porting some software to the ST/Falcon. I wondered
if code generated by GCC is as good (fast) as that from
say Latice C 5.6. There are some advantages to using
GCC - to do with ease of porting - but I could use Latice
if there is an advantage.

HMMMM...There are several file formats for Cubase: ARR/ALL/PRT/DRM/IPS
and even MID! Which one.???.not that I know anything about it! However
a "WHY" might be in order to see what you actually want.

Hi Ben.

I havent used it myself but Hisoft programming tools have a good
reputation. Some well known software has be written with it.

Hi

Good point, not having used Cubase I was unaware of the range of formats
used:) The format I need is for the .ARR files.

Cheeers!

It's really old and can't compete with Pure Pascal (which is also more
Turbo Pascal 7 compatible).

There are also some fine GEM libs available for Pure Pascal so if you
want to do some serious Pascal programming try Pure Pascal.
Personal Pascal is fine if you just want to try out some things in
Pascal.

Greetings,
Matthias

Hi Steve

I guess I am trying to understand what you mean by "format". For example: What is SAVED when you save an ARR file from cubase? These would include things like stuff in the Inspect window,patch changes, and sysex material you have on a track. Then you could taker several ARR files and put them together to form a .ALL file or rayher a song which contains many arrangemets.

Or are you talking about if you bring a file into TXT editor: what is there?

HMMMMMM...perhaps if you tell us WHY? Why do you need a "format" on ARR. then I can try to understand what you want.

Tim (thinking too much!)

I would like to invite anyone of you to the Atari-midi mailing list.

What I'm after is the format the file is saved in: the header of the file and where/what the segments in the file are.

Very much like an executable program file has to be in a certain format for it to be run; the header which contains all the info for the data, bbs section etc..

I am trying to recover a disk that has nothing but .arr files on. It looks as if the .arr files have header or pointers for the various sections of the file; much like tracker mods etc.

If I can find the start of the file, I want to be able to work out the length (or be very close to it). I will then be able to try and suss out where the other bits of the file has gone, hopefully.

So in a nutshell I am after the header info that tells me where the relevant sections are leading to the total length of the file!

Hi steve

Looks more complicated then I thought. So have you have tried loading these into Cubase, and they do not load? Or are you somehow trying to convert them to midi files? If you want to zip them to me at tconrardy@hotmail.com I can bring them into Cubase and convert them. (which is he only way to convert a Cubase arr into a midi file) I did try taking an ARR file into a TXT editor to see what it looked like. Just code to me. I am not a programmer. perhaps you need a programmer. however, if the above is true, feel free to send me the files and i can convert it. If you have a PC, you can get GEMEXPLORER to read the files onto your PC HD.

Hope this helps a little

Tim

I have a strange problem with CF-Lib, it returns the wrong objekt number
to the exit-function for the main dialog in Taskbar's config.ovl. Instead
of returning WD_CLOSER (0xff) when the closer is clicked, it returns
0xb. Can anybody tell me what happens?

Hiya

No! what I am trying to do is recover files from a disk that has gone
wrong. There are 2 files on the disk, one of which is quite simple as I
know the length and start of the file. The other, on the other hand, I
don't know the length OR start cluster/sector.

What I need to do is track down the header, start of the file, and try
and suss the length out from the header (hopefully). I have already
found the end.

I would presume the first few bytes of the file will give info on how
long each segment is, whether it be the 1st track, 2nd track or layout,
or an offset to the next segment.

There MUST be some documentation, or someone that knows, somewhere!

  Steve

OH...looks like I was barking up the wrg tree. Sorry to lead you around
like that :-) I guess that is out of my feild. perhaps a disc utility
will do the job.

Tim

Dear Atari programmers,

I purchased my Atari 1040 STF a week ago, and now I wish to port the disk magazine engine to this platform.

To do this job I need a decent C compiler (or cross-compiler like gcc, if no good native compilers are present). Could you give me any recomendations? Ofcouse I am not able to pay for commercial product, because the project is non-commercial.

Any recomendations are very welcome!

Best regards,
 Adrian

Hi,

Currently I'm using GCC 2.8.1 and would like to use GDB (and later
on GPROF) on my program. I found a GDB 1.8 somewhere. Can anybody
tell me if that's usable or which version I would need and where
I could find it (and maybe matching documentation).

Thanks
Gerhard

I found it on a CD but it was Christian Felsch's version (don't
remember his homepage at the moment). If you use mint you could
also try the newer 2.95.2 from Frank Naumann's page at
http://wh58-508.st.uni-magdeburg.de/ftp/pub/mint/programming
but that's quite some MBs.

Hello alls Atarians
and sorry for my disastrous English

I have a problem whith Drag and Drop
protocole. The folowing code derived
from (Alexander Lorenz)' sources,
compiled whith Pure C don't work correctly.
(Magic PC, NAES Falcon, MagiC Falcon, tested
 and the problem is the same)

With my code as receiver whith this senders:
   Jinnee, Cab, all is OK.
   Qed 4.52 which use code from (Alexander Lorenz) don't work
           (receiver (my code) wait for DD_TIMEOUT in Fopen() and return
            handle -33 File not found).
   my code as sender thereafter, don't work
           (receiver (my code) wait for DD_TIMEOUT in Fopen() and return
            handle -33 File not found though
            file name is good !!!).
   Luna the system freeze completly.

With my code as sender on this receivers:
   Cab all is OK.
   GCCShel which use code from (Alexander Lorenz) all is OK.
   Qed 4.52 which use code from (Alexander Lorenz) don't work
            (sender (my code) wait for DD_TIMEOUT in Fselect() and return
             i = 0 and handle_mask = 0)
   my code as receiver thereafter, don't work.
            (sender (my code) wait for DD_TIMEOUT in Fselect() and return
             i = 0 and handle_mask = 0)

I don't understand, bug in binding of Pure C ??? why receiver can't open
a file whith correct name ??? is the sender's file looked ???

Help me please
                            Roland

Right now Stormfront Studios is adding to its staff and looking for
people to create Next Gen Games for the X-BOX and PS2. We're looking
for an Entry Programmer, AI Programmer, Sr. Programmer, Lead Programmer,
Development Director, Sr. 3D Max Artist, 3D Animator and/or Art
Director. Interested or know of anyone who may be interested? Please
let me know if you can help us out we need your talent!

Thanks,
Marta Daglow

I managed this once on a logic 2.0 song file
many years ago: it took days with a pencil and paper
and a hex sector editor.
Gemhexed I think.
Good luck ;-)

Hi,

Is there anybody who has used gprof successfully ? I set the -pg
option at GCC, the function main of my C program terminates with
'return 0' but after running my programm I don't find a gmon.out
(nor any other new file). What else can be wrong ?

Another question is whether anyone could point me to some infos
related to 68030 asm optimization. I already have the original doc
from Motorola and a several years old file about optimization
written by artTBL. Any other doc where I could get new ideas ?

And finally, is there somebody willing to share his/her Falcon
256 color mode asm sprite routines ?

Thanks
Gerhard

Hello!

> Is there anybody who has used gprof successfully?

Yes, I :-)

> I set the -pg option at GCC,

You also added -pg at the link stage? This is very important as otherwise
the normal startup module is linked and not the profiling startup module.

> the function main of my C program terminates with

> (nor any other new file). What else can be wrong ?

You use latest MiNTLib (0.55.3-4)? You have MiNT running?

Tschuess
...Frank

Well....the answers I got is that this info is property of Stienberg,
and you would have to contact them to get it. YIPS! they don't listen
to any Atari-Users anymore. Sorry I could not help further.

Tim

I would like to invite anyone of you to the Atari-midi mailing list.

Hi

It looks like I've got to do this the HARD way:(What I could really do
with is a legit copy of Cubase if someone has a copy to give away. It
may help in the file build! and anyone else in the future!

Hello,

Solution:
```
    make a wind_update(END_UPDATE);  before
    call D&D functions and all is OK now.
    the GEM Magager should not be in BEG_UPDATE
```

state. Why that ???.
Bye

X-posted to comp.sys.atari.programmer...

The Prologue:

I've been trying to make sense of the .TIFFs spewed out by Demon's D-FAX service. Now read on...

on Sat 30-09-10 13:14 John Whalley wrote:

>"G. R. Greenway" <augeas@elis.demon.co.uk> wrote in message

>
>Can't help with the header, but FWIW, they are multi-page CCITT TIFFs,
>apparently a format designed for faxes. This question has been raised a

I was getting quite determined to nail this problem, so I started throwing some C together. The .tiff file I've been working on has 17 12-byte image file directories (IFDs), here they are:

Number	Tag	Type	Count	Offset
0	256	3	1	1728
1	257	3	1	2282
2	258	3	1	1
3	259	3	1	4
4	262	3	1	0
5	266	3	1	2
6	273	4	1	8
7	274	3	1	1
8	277	3	1	1
9	278	4	1	-1
10	279	4	1	4563
11	282	5	1	4782
12	283	5	1	4790
13	284	3	1	1
14	296	3	1	2
15	297	3	2	65537
16	305	2	9	4798

The third tag, 259, indicates the type of compression. Like GemView said, this has a value of 4, completely undefined in the tiff 6 spec. Gemview also agrees on the dimensions of the image, 1728x2282. Tag 9, 278 indicates that the whole page is expressed as one strip. Tag 6, 273, has an offset of 8. This is ludicrous, as it's meant to point to the compressed data of the 1st strip. Both the tiff 6 spec and the tiff class F spec that deals with faxes can be found at:

ftp://ftp.faximum.com/pub/documents/

There's no mention of what a value of 4 for the compression

tag could mean, and I've no idea what happened to the strip offsets.
Does anyone[1] want to help with the fight ?

"Augeas"

Mario, still want that .tiff file ?

Oops, not only did I post this twice, but the value of 8
isnt ludicrous, just rather peverse. The data starts from the 8th

byte, just after the header, with IFDs tacked on the end. Strange,
but legal. Still no idea what a value of 4 for compression means,
though.

I admit I didn't look close enough at the linker options. Sorry :(

But now my problem is replaced by another one. I got a gmon.out
of approximately 200k but when I say

gprof myprogname > reportfile

gprof says no error but also creates no report file. Any idea
what I did wrong this time ?
Is there any way to check whether the gmon.out is okay ?

Thanks for helping me up to here
Gerhard

Oops again, this really is a case of RTFM. It just means
CCITT with knobs on. They _aren't_ class F tiffs, but they're not
baseline, either. This thread may not bode well for my chances of
success, but I'll see if i can write something that will chop them up
into .img files. See you later. _Much_ later....

It says 'atariST-TOS patchlevel 9 (4. Mar 1993) but the two other
versions I found are even older. When I run it, it creates an
output file with 0 byte length and nothing else happens.

This is an very old gprof version. If you use gcc 2.95.2 and the binutils
2.9.1 you must use the gprof from this packages too.

Hi,

I have only one question :)
How can I using Pure C change the resolution in Falcon?
I mean for example from 1024x768x16 on 640x480x256.

Since I failed at installing 2.95.2, I think mainly because I
couldn't get rpm to work and fileutils and sh-utils unfortunately
only exist as rpm archives, I'm still using 2.8.1.

I didn't try the gprof from binutils 2.9.1 with the 2.8.1 generated
files because I was sure it wouldn't work, or would it ?

There are also tar.gz versions of the gcc, binutils, mintlib.

> I didn't try the gprof from binutils 2.9.1 with the 2.8.1 generated
> files because I was sure it wouldn't work, or would it ?

No, if you update you must update all things. About the older gprof I
can't say much as I never used it for more than a test (and the test
failed).

Yes. I downloaded them but somehow the system didn't work as it should. Maybe because the makefile called fixstack and I didn't notice then that I should change that to a call of stack.
Then I believed I need fileutils and/or sh-utils and they were rpm.
But I will try again in the next days to install 2.95.2, hopefully without the need to ask lots of questions in the process ;-)

Thanks a lot
Gerhard

The new system siginifcantly differ from the old tools. Don't expect that
old projects work without small corrections.

> Then I believed I need fileutils and/or sh-utils and they were

With rpm2cpio & cpio you can easily unpack it from hand.

vrt_trnfm() transforms a video specific bitmap to standard planes and vice versa.

Use standard planes for files. You wont suffer from the differences between
graphic display systems.

OK, so what is the fname in the INTIN vector? described as specifying the
GEMDOS file specification for the GEM bit image file to print. Is this an
input file that it will then print to the workstation?

Also if I open a memory.sys workstation can I use commands to "read" the
memory like a screen?

Yes, I know more...
You can find the homepage of ACSpro at
http://www.atari-computer.de/martin_elsaesser/, but its only in german
(I had yet no time to translate it)... ;-/

Currently I am porting the libraries from Pure-C to GNU-C - it's C,
not C++... ;-)

If You have further questions, contact me: mailto:martin_elsaesser@atari-
computer.de

Greetings

>>v_write_meta() will create a metafile.

Oops, v_write_meta() is used to send special opcodes to the metafile.
vm_filename() opens the metafile and standard output functions write
to it.

>OK, so what is the fname in the INTIN vector? described as specifying the

If you are talking about v_bit_image(), yes.

>Also if I open a memory.sys workstation can I use commands to "read" the
>memory like a screen?

Yes. You can "read" the image using v_get_pixel(), or just access
bit image directly (which is a lot faster). Note, opening a memory
workstation requires parameters not supplied by the v_opnwk() linkage.

What do I need to do to open a memory.sys file other than opening the
workstation. Assume that I am quite familiar with opening and writing to
a meta.sys file.

My interest here is in trying to create a bigger image so that I can
create better .IMG files than simply converting the standard screen into
an IMG file

Also perhaps you know the answer to the following.

When I try to get a bounding box for text on a meta.sys file I always get incorrect (really incorrect) value. I am using SPEEDO (I know I should convert but I am just fooling around with the Atari, my work is all done in a windoze world).

I think its best to leave trap #0 (and trap #15) free.
This follows the existing pattern. 1,2, ... ,13,14

If you think your dll system is akin to BIOS,XBIOS, use 12, otherwise 3.

This is pure intuition. No arguments. :-)

Are there any reserved trap vectors on the ST beyond the ones used for
calling GEMDOS, GEM, BIOS and the XBIOS?

My "Toolbox" DLL engine is currently using "TRAP #0" and I just want to
make certain that it wont clash with anything else using that vector.

(I also have a strange recollection that an old Motorola 68k debugger
used to tap into that vector)

As part of the Toolbox DLL engine detection procedure, I have implemented a new XBIOS function, "xtlbxInfo()", which will return a true/false result, and fill in a buffer with info about the Toolbox DLL engine.

If memory serves, (I haven't done anything with that XBIOS-interface part of the Toolbox in a month or so, so I cannot recall the exact number) it is either function number 'tl' (0x744c) or 'tb' (0x7442)

Are these numbers "safe"? Do they collide with anything else?

Or would it be easier if I added a new 'TLBX' cookie to the cookie jar?

I've just checked - the number is $746C (29804 decimal)

Eucalypt Software - Makers of Autopost & Rocketfuel --- Ripped Me Off!!!
-
All potential buyers should be warned to steer clear of this company. They have a repeated pattern
of ripping people off and ignoring requests for support.
-
I know someone who sent in the $10 registration fee for Autopost TWICE (thinking the first one may
have gotten lost) and in both instances, never got a registered version of the program and all of his
emails were completely ignored.
-
I myself purchased Rocketfuel on-line and had to pull teeth to get an unlock code. The web site was very
quick to take my money, but no registration/unlock code came for days and days. I repeatedly emailed them,
only to receive nothing but autoresponses. After 5 days I sent them a message stating that if I did not have
a working version of the program by the close of business that day, that I would challenge the credit card
charge. Magically, the code arrived several hours later.
-
What kind of way to do business is that?
-
In any case, its academic... there are other products available for free that do virtually the same thing
and I only wish that I had known about them before I wasted my time with Eucalypt Software.
-
If your in need of automatic news posting software, there is nothing better than "NNTP Power Post 2000".
It's graciously been made available free from the following web site:
-
http://net-toys.8k.com/
-
Save your money... your time... and the aggravation!
-
Peace,
-
PPN
-
-
PS: I have no affiliation with the makers of PowerPost 2000.

Hi,

Can someone tell me how the MFDB structure works.
I mean how is organized the memory with graphic (mfdb.fd_addr).
Is point after point or first for example 8 planes for one point, then 8 planes for next point or ?
Is it byte or word or ???

Hi,
> vrt_trnfm() transforms a video specific bitmap to standard planes and vice
versa.
>
> Use standard planes for files. You wont suffer from the differences between
> graphic display systems.
As I know the vrt trnfm() call is unable to transform to a high color format.
But all/most Milans will run in high/true color (I think).

And I don't know how to convert to true color!
(read NVDI 4 or 5 documentation)

Hi Rafal

this is what my Atari Compendium says about MFDB:

[...]MFDB is defined as follows:

```
typedef struct
{
   /* Memory adress (NULL = current screen).
      If you specify a value of NULL, the
      rest of the structure will be filled out for you */
 void *fd_addr;

 WORD *fd_width;   /* Form width in Pixels */
```

```
 WORD *fd_height;  /* Form height in Pixels */
 WORD *fd_wdwidth; /* Form width in WORDs (fd_width + 15) / 16  */
 WORD *fd_stand;   /* Format (0 = device specific, 1 = VDI format */
 WORD *fd_planes;  /* Number of Memory planes */
 WORD reserved1;   /* reserved (set to 0) */
 WORD reserved2;   /* reserved (set to 0) */
 WORD reserved3;   /* reserved (set to 0) */
} MFDB;
```

I hope that these Infos are useful for you.

Heiko

If you don't mind cross-assembly, you can try xa:

The NinjaForce Assembler and Lisa are both freeware and available on
the net. The ownership of Merlin is currently in question so you'd
still need to find a used copy of it if you wanted it. Orca/M is
available for both the 8 bit Apple IIs and the IIgs and are still
being sold by the ByteWorks.

Thanks for your help.
I know how MFDB structure looks like. I was looking for memory
organization (mfdb.fd_addr).
But now the problem is solved :))
Thanks guys for your help :)

You could try the Atari Web Ring for links, as I do know there are
several sites.

http://www.webring.org/cgi-bin/webring?ring=atari;list

I will be having a portfolio section to one or two of my web sites.

Alfred Arnold's AS should be the perfect match. It is available from
http://www.alfsembler.de - look for the unix C version, it should compile
just fine on a modern MiNT setup, probably on other compilers than gcc, too.

Is there an assembler like DevPack(Atari ST) on Falcon030?
Where can I find it?

Thanks for any help

David.

Yes, I did want a cross assembler for DOS preferrably. Thanks.

Hi

There's Devpac 3 which caters for the Falcon, I haven't tried Devpac 2
but there shouldn't be problems.

Devpac 3 can be obtained from HiSoft in the UK: http://www.hisoft.co.uk/

Devpac3 is supposed to support the Falcon, You would probably find
"Modern Atari System Software" useful with it. Both were published by
HiSoft, I don't know if they're still available.

I've heard the annual sale and swap meeting of the Columbus,
Ohio, Atari club will be taking place on Saturday, September 9th.
Here are some details I've heard about this event:

Time: 9 am to 3 pm (Eastern Daylight Time)

Place: Oakland Park Community Center, 980 Lenore Street.

Location: Use East North Broadway or Cooke Road exits of I-71,
northeast side of Columbus.

Admission: $4 per person. (Maximum $8 per family.)

The Atari Computer Enthusiasts of Columbus will be holding their
annual swap meet in Columbus Ohio. Where you can buy, sell and trade
everything Atari. It will be held on Saturday September 9th from 9
am to 3 pm. See our web site at acec.atari.org, or email me for
further information.

Hi

Some of you may have seen this in the journal of TT-Digger & AHCX

I thought it might be nice to give it to the public.
Basically because it is only in dutch.

I didnt want to translate it myself, because the naturality of the language is essential. Also because of differences in sentence order in languages it may be necessary to change the programming of the little generator.

So you can find it on my homepage (in sig) both as a ACC and source.

Because everybody understands english I need a english programmer who understands dutch to make the first translation. Then it can start conquering the world.

The stuff that needs translating is in TTIJD.C

Hi

Your C programs behave unpredictable, or bomb?

Try the following:

Go through all your for statements.

Rewrite anyone more complex than for(n=x; n<y; n++) into a while statement
and be surprised.

Hi,

Been surfing the net, got lots of downloads, know about the Howard
system (not much about what it is, but that it exists and is expensive)
and about emulators (Like Handy/MacOS). I also have an Amiga 2000HD
on order and may use it to develop with a Howard System and a Lynx.
What I really would like to do is this

1. Have a Lynx around.
2. Interface it with a Macintosh G3 B&W and serial cables (or some

type of communications cable).
3. Be able to download programs to the Lynx.
4. Use CodeWarrior MacOS and some type of extension for cc65
(some type of 65C02 C compiler)
5. Make this all work and have docs for the Lynx and its routines.

So, basically I want to use what I have now, a Mac B&W and tools
that I have (CW and MPW, preferrably CW) and develope and download
games to the Lynx.

Any thoughts, ideas or the like on how you have done Lynx Programming
in the past are more than welcome and helpful.

Thanks!

Check out The Macroassembler AS at
http://john.ccac.rwth-aachen.de:8000/as/
This assembler takes a bit to get used to but it supports more CPUs than I even knew existed and it keeps adding more. Yes this assembler is currently in development and the tech support is good. It is free as well. I am using it to program the NES which uses a 6502 core and I will move to the Sega (68000 and Z80), and the SNES (65816). This assembler supports all of these processors and more, a lot more. The 2600 uses the 6508? It is also a 6502 core. Anyway, have fun. BTW the Atari can only address 8K of RAM/ROM (only twelve address lines). The standard 6502 can address 64K. Curious, what are you going to use it for?

Frank

I've recently needed to get data input from a form using G_FBOXTEXT
objects.

However, the data I need is a floating point number consisting of a
differing number of digits and a decimal point. I cannot use a te_ptmplt
of "___.____" and te_pvalid of "9999999", as this pre-supposes three
digits and four decimal-places, which may not be enough for this
application. (Reworking the text, inserting the decimal point and
removing internal spaces before converting to a number can be a pain as
well)

Unfortunately, there does not appear to be a te_pvalid character that I
can use to allow this.

The nearest validation character to what I need is "P", but this also
allows non-numeric and non-decimalpoint characters.

Is there some way of inserting myself into the AES "validate" phase and
allow/disallow the entered keypress?

I have one Copyright 93-94 as well - _but_ the latest version is a
CD-ROM, with HTML and PDF formats. It also has a lot of demos on it. It
was published in 1996 by Toad Computers and the original author Scott Sanders.

An Oric emulator exists for the Atari ST (and Falcon), but on the ST it is just too slow. Being a bit of a fan of the Oric I would love to see a usable emulator for the ST.
Anyone up to the challenge of improving this thing ?

www.atari-computer.de/cpepper/oric_e.html is the place for the existing one.

>MMU, since it has it's own, or...?

Hu? Why would you need an MMU? The ST has none and runs just fine.

I guess you are confusinga paged-style MM;U (which the 060 has) with a
memory controller (which Atari called "MMU"). The memory controller is
needed anyway, regardless of the CPU used. It will have a different
interface for 00 and 060, though.

>The thing I'm wondering is... can you have a dual 68040 or 68060 system and
>then address/access data 64-bits across, allowing the use of DIMMs, instead
>of 72-pin SIMMs for memory? Can you use SDRAM? Things of that nature...

No. But you can use DIMMs in a 32-bit system (and of course without throwing
away half the capacity). It's the same as using PS/2-style SIMMs (which are
32 bit wide) in a 68000 system (like the MagnumST does).

Hi,

Some weeks ago I asked for help because GCC 2.95.2-4 did compile
a source but the compiled program crashed with memory violation
although another guy who compiled the same source with GCC 2.91.60
got a working program. In the meantime I installed, one after the
other, 2.91.66, 2.91.60 and 2.8.1. I even tried it after deleting
the whole contents of the partition. Every time with the same result.
So I think the problem lies somewhere else and not with the GNU C.
But I haven't got the slightest idea what else could have an
influence on the compilation result.
My system is a CT2 Falcon with MiNT 1.15.1 and N.AES 2.0. The guy
where it works has an AB40 Falcon with KGMD. Quite some time ago
I had MiNT 1.9 IIRC and N.AES 1.2 and GCC 2.8.1 was able to
compile that source then.

Anybody out there with any idea what could be the problem ?

Thanks
Gerhard

According to a gaming magazine I just read, Hasbro *ONLY* paid $5 million
for Atari's entirety. This now means that a buy back is NOT outside the
realm of possibility. Afterall, the computer devision surely is only one
small fragment of the whole, no?

One thought for backward compatibility is sort of dual-boot where when you boot-up you choose from multiple TOSes (similar to GEMulator). The best would be a new TOS somehow taking the old 'bugs' into account that are needed by some programs though. It was a disappointment that several programs no longer worked on the Atari TT. I remember that David Small had found a solution to some, but didn't want to reveal it.

To me it is a shame it only went for that much. Like everyone knows, Hasbro was only interested in the rights to the older classic games. It should not be too hard to get the computer rights. It is too bad also that Hasbro is not going to remarket the Lynx or the Jaguar...

You have the right idea. I *do* want backwards compabibility, but ONLY for porting purposes to the new GEM OS. That backwards compatibility would be in the Atari ST emulator you can switch to/from, while the new GEM OS is on a seperate ROM. Both read from the same HD format, so you learn the new OS, go over and port the old Atari app(s) to it, then boot into the new GEM OS and try it.

In the end, when all the apps are ported, those programs will look like they're running on a modified TOS (much like the way the Milan does today), but, in reality, you will NOT be able to run those same apps on the emulator anymore, when the port is complete. GEM will look similar and be similar functionally, but the enhancements I've heard mentioned (and others) will make it much better. Does it matter if the apps you love run on an old model ST or a new Atari if they function identically? I think not. That's the whole premise to porting... to get the apps we love brought up to date with todays hardware, not just force them to run on newer hardware with a hacked up TOS. By the way, that Milan TOS picture I've seen on their site is the ugliest I've ever seen! What, does it use only 16 colors, if even that?

With the Atari name restored and new computers that function similarly to the old ones (maybe even look similar), you won't know the difference except that everything is more powerful. I refuse to believe that a 68040/060 is incapable of doing everything, including browsing the web. All you need to do is optimize the hardware and software to do the job.

Sure, it isn't as fast as a Pentium III or an Athlon, but if you don't NEED that power, why have it? And, with time, we'll get there... maybe sooner than you think. It's all about SUPPORT. If your system is no longer supported by the company and all the programmers go away, that sure isn't any fun... it's like... well... like living in a ghost town all by yourself! Not my idea of a picnic.

You can only keep the dying (legacy Atarians) alive for so long on life support (clones) ... you either have to pull the plug (everyone moves on) or revive them (srestore Atari itself) to make them live again. The latter is

what we propose. It's all quite simple. We just need to formulate our plan. Naturally, it's also dependant upon whether or not hasbro will even budge. If they refuse, nothing we say or do will change that... unless multiplied millions are accessed to do a hostile buyback, which I think could work, but... it would require too many resources (both financially and supportively) and, considering how little vocal support I've gotten from y'all, I don't think a direct buyout of any amount would work. So, we go to plan 2!

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision.

Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine sticker (17K) or a Banner ad (5K):

==========

What it Means to be Green

"At the root of all Green political action is nonviolence, starting with how we live our lives, taking small, unilateral steps toward peace in everything we do. Green politics requires us to be both tender and subversive. Affirming tenderness as a political value is already subversive. In Green politics, we practice tenderness in relations with others; in caring for ideas, art, language, and culture; and in cherishing and protecting the Earth. To think Green is to build solidarity with those working for social justice and human rights everywhere, not bound by ideologies."

-Petra Kelly

I just read that Atari Games (owned by Midway/Williams) is no more and that
Hasbro may have been the force behind it. If that's true, it may very well
be unlikely I can achieve my dream, since this would seemingly indicate they
want only one "Atari" for their own purposes. *sigh*

It may be sad news ... but does that mean we cannot
continue? With a bit of work, it is possible to
construct a new machine that lies outside of the
existing tunnel-vision of most computer users -- one
that would delight and amaze.

Take a step back. Think "what would the computer
owner want to do with his/her computer?". Once you
have that idea firmly in mind, you can work wonders
with the existing TOS/GEM OS.

Which is why it still flourishes, even in clones.

I think you care too much about the name.

Atari (as we know it) is dead and gone alright. So therefore, even if
you gain the right to the name "Atari" and actually get to release a new
computer I'd say it would not be any different to any of the existing
clones really. It would be a TOS compatible computer (hopefully) but
with the "atari" label on it.

As I've said before, clones are simply an effort to keep a dying breed from
total death. It's a way for companies who loved Atari to pay tribute to the
loyal following. Do you find Amiga clones? Not that I've seen. And why is
that? Because somewhere, somehow, someone was able to keep Amiga alive, in
a genuine real sense. Not just by cloning the original systems, but by
actually keeping the computer, itself, alive!

Perhaps it is that the Amiga was a more special, more powerful computer to

begin with. Or that it had a more popular following all over the world.
But, for whatever reason, Amiga is still alive and Atari is dead.

Kinda odd, isn't it... a brand name/computer lives on from one company that
died, while only clones of a computer exist from another company that was
killed. Maybe the suicide of Atari forever cursed us from ever gaining back
the glory days of old. These days, it seems, are good days to be an Amiga
user.

I shoulda bought an Amiga 1000 in '86 instead of an Atari 1040ST. It's that
simple. My loyalty to the company, Atari, has lead me to this dark present,
while Amiga users have something to really cheer about these days, from what
little I know about it.

Any opposing thoughts or insight on the matter?

IBM is still around, as are computers made by them. Sorry, no comparison.
If Atari clones existed in the midst of Atari computer, that wouldn't bother
me one bit. But there are no more Atari computers.

The old Atari was killed by the (!!!) Tramiels! If Atari was alive today,
makinbg computers, I'd buy one of the spot. New/old. It doesn't matter to
me. Just make sure it's by Atari and Atari based in the USA!

To me a motorcycle that looks/works like a Kawasaki is NOT a Kawasaki
motorcycle. The name is half the importance! At least, to me, anyways...

Again, why is the name so important? The TOS-platform (which is what
matters to me) would certainly benefit more from people supporting the
machines that already exist (and perhaps improve their performance)
instead of wasting money on buying back rights to a company name.

> It's a way for companies who loved Atari to pay tribute

If a new ATARI computer actually would see the light of day, it would
not be a product of the old atari anyway. It would be a completely new
company, that would have to design a new computer from scratch. You
would probably need to have an updated TOS compatible OS. What would
then make it different to any of the clones?

> But, for whatever reason, Amiga is still alive and Atari is dead.

Yeah, sad but true. Perhaps it is time for you to get over it? The
company is dead but the platform is alive. I'd say, put your efforts
into something that is good for the platform instead of chasing ghosts.

> I shoulda bought an Amiga 1000 in '86 instead of an Atari 1040ST.
It's that

> simple. My loyalty to the company, Atari, has lead me to this dark
present,

Seems your loyalty to the company is more important to you than your
dedication to the TOS-platform. I care for the atari platform, the
company itself is dead. If you would like to see Atari computers
shipping with the name "atari" on them, it would be easiest to help
Medusa systems, or Milan to get the rights to the name "atari".

That was not the point really. You seem to have a strange idea that only
the company that once set the standards is valid. Even if it is dead..
So if IBM is gone, lets leave the PC:s?

> > If a new ATARI computer actually would see the light of day, it would

You are beginning to sound weird. You mean you⍰d buy an Atari right now on the spot just for the sake of it? Why is it important that Atari is based in the US? If that is the reason for you to resurrect Atari I don⍰t even want to wish you luck, even if I⍰d love to see Atari back again.

A new computer (even if made by a company called atari) would still be a TOS clone, nothing more, nothing less.

Yes of course, but if Kawasaki stopped making motorcycles people would not through away their drivers license...

> The name is half the importance! At least, to me, anyways...

Name Atari would be cool to have, but it would not matter if Ataris were made in Paraguay, USA or Germany. And I dare to promise you that to most people still active on the Atari scene, it is TOS as a platform that matters. But if the name is half the importance I don⍰t think you are at all well suited to ahve anything to do with the "resurrection" of Atari computers.

I am getting tired of this thread, so don⍰t be upset if I choose not to reply again, because that *might* happen. You seem only want to comment parts of the stuff that some posters have written. For example, have you ever once explained why you need to have Atari based in the US?

I think it is a pity you do not use the energy you obviously have to do something to support the TOS computers that are alive.

The reason I want Atari to be US-based, is for the same reason that makes
having an Atari (um, I mean TOS... excuse me) clone nigh impossible... if
Atari was based elsewhere, how hard do you think it would be for me to
actually get one? VERY! Not to mention that Atari headquarters has ALWAYS
been in the US (California), that I know of.

But then, for the same reason(s), you probably DON'T want it in the US,
which could be understandable.

Luposian

P.S. Just remember, what you call TOS computers today, were taken from the
heart of Atari years back. If it hadn't been for Atari, your precious TOS
clones wouldn't even exist! Never forget that. Atari is why they exist
today and why I am fighting to get them (Atari) back. I don't want a ghost.
I want the living!

Perhaps you could create a new company that writes screen and printer drivers for the USB on the Milan?

To date know one has pickup the offer to do this. They are still looking for someone to do it.

You could could make drivers to support the Atari products run on clones and emulator to interface with Atari VDI.

Call it SVDI, SuperVDI.

People want their TOS computers, right? They want their slots, right? They want it all, right? Well, so do we!

What if (the new Atari) computers were simply modified PCs? You alter the BIOS a little, to allow for an Atari splash screen. You have an Atari ST emulator that boots first, unless you press a certain key to go into GEM2000! And since GEM was originally written for a PC, can you imagine how fast it would run on a Pentium-class (Socket 7 233MMX, mind you) system, not to mention a Pentium II/III, if optimized? Yee-haw!

Sure, you could more or less do that already with a PC today, but assuming anyone cared about the BRANDNAME (unlike most people here, it seems), it still wouldn't be the same.

We would have affordable, already-made PCBs with all the slots you want. We modify drivers to work with GEM for the cards we install and... whoo-hoo! We've got Atari computers again, more affordable than EVER, because parts are already available and cheap!

The only thing we need to do is modify: the BIOS, an Atari ST emulator to work in GEM (or even FreeDOS, if possible), and GEM to work (really fast!) on a Pentium-class computer! In fact, if we played our cards right, people might ACTUALLY be able to run their apps on both the ST emulator and the new GEM! But we HAVE to rewrite as much as possible to optimize it for today's PC environment!

Sure sounds feasible to me and a LOT cheaper than trying to build a custom 060 or PowerPC board, plus modify the emulator and GEM to all that stuff. Not to mention the drivers... oy!

Now see what you clone-people have done? You've taken me from my grand classic Atari ST designs to this altered plan where there's very little difference between a new Atari and a standard PC! All in the interest of finding some way of getting Atari back!

I gotta get some sleep... stuff to dream about! Yeah!

Ok, now that does make some sense :)

>how hard do you think it would be for me to
> actually get one? VERY! Not to mention that Atari headquarters has
> ALWAYS been in the US (California), that I know of.

Yes but I guess that would not be very important except for sentimental
reasons really, if you easily could buy a TOS-computer in the US, with
an english OS installed ;)

> But then, for the same reason(s), you probably DON'T want it in the
> US, which could be understandable.

To me it doesn⍰t matter where the company has its headquarters or the
computers are made. I just wish that they would be available to anyone,
no matter where they live. It seems to me that the people behind
TOS-computers that are available now could do a lot more to make them

available to people outside their own country.

It seems to me as if several german companies could do a lot to focus on other markets than their own.

I would be more than happy if somebody managed to start up (a new) Atari again, and make it work. Sure I'd be happy if they were located in US or Germany, as long as I can get hold if the product without too much trouble,

> P.S. Just remember, what you call TOS computers today, were taken from

hehe, I do not even own a clone. :) Still working hard with my 4Mb STe, 100% Atari Corporation stuff ;))

> Never forget that. Atari is why they exist

Yes of course, no need for us to argue about that! :)
I would not mind having the company back, but I would not want it back just for the sake of it.

 You know that you're now talking about Yamahas with a Kawasaki badge, and
that you're now talking against yourself... again? The above would be
applicable to Hades/Milan boards, and you would have all you need.
Computer Direct used Hades boards to build Direct T60's, so I'd imagine
you can use Hades boards (or Milan boards, as I'm sure theyd be
interested, if SERIOUS) to build Atari machines. So, now we're back to
"slap a Atari badge onto a Hades or Milan", which is much better than
"slap a Atari badge onto a common PC".

 STOP IT, before it gets silly to the point where it explodes.

Apparently it has not sunk in that the hades and milan boards
are custom made. The term clone is so over used in the PC market
one could get confused seeing. However I stronglg feel this
chap has never see one, hense clueless.

Hold on a sec, have you researched Amiga? There is at least one
clone on the way "boxer" and is the amiga market really better?
Their idea is to sell a platform independent OS under the name
Amiga, with some silly slogan "In the spirit of Amiga".
A move like that says what? Forget the Amiga as you knew it.

So I say to you please read up on current events...

Sure it has slots, but to get some performance you have to
put nearly a computer in itself into an aging slot, one could
argue if it's even an Amiga at that point... it sure isn't
a card from Amiga but some third party.

Do not let that bother you until you actually find out for yourself. I
think Hasbro does not want the Atari name to have anything to do with
games, but computers are another thing. Do not give up yet. The one thing
to do is to ask Hasbro themselves....

Most of the serious development work, starting with the MEGA and
TT, was done by Atari Germany.

Have you read the textfile that comes with Rainbow2? It explains the

format very well, at least enough for me. But if you prefer asm-sources,
I can dig something out for you. The only thing I haven't tried is the
animation sequences which are also in the SPR-file.

Regards,
Henrik

I have a problem in LED, but only in this situation MagiCMac+NVDI, tought I didn't test much, it seems it has to do with the odd Mac resolution 832x624.

Spaces and white spaces are filled black instead of white, I think there is something odd in the nvdi call vro_cpyfm at this resolution, the rcopy function is called to just fill a white rectangle, but with this call and the NULL addr parameters something goes wrong, so I changed the call with a vr_recf. Anybody knows about this ? Maybe I need to fill some other pf the MFBD parameters fields ? It works ok with the new function tought, I think I do not need the blitting call, but just to know why...

```
MFDB src, dst;

word *setxy(word pxy[], word x1, word y1, word x2, word y2)
{
     pxy[0]  = x1;          /* linke obere Ecke */
     pxy[1]  = y1;
     pxy[2]  = x2;          /* rechte untere Ecke */
     pxy[3]  = y2;

     return pxy;
}

void rcopy(word xs, word ys, word ws, word hs, word xd, word yd, word mode)
{    word pxy[8];

     src.fd_addr = dst.fd_addr = NULL;
     setxy(&pxy[0], xs, ys, xs+ws, ys+hs);
     setxy(&pxy[4], xd, yd, xd+ws, yd+hs);
     vro_cpyfm(handle, mode, pxy, &src, &dst);
}
/* Mike 14 8 00 */
void rwhite(word x, word y, word w, word h)
{    word pxy[4];

     setxy(&pxy[0], x, y, x+w, y+h);
     vr_recfl(handle,pxy);
}

/*#define RWHITE(x, y, w, h)  rcopy(x, y, w, h, x, y, 0)*/
#define RWHITE(x, y, w, h)  rwhite(x, y, w, h)
```

Jared Falvo <luposian@mailcity.com> skrev:
: People want their TOS computers, right? They want their slots, right? They
: want it all, right? Well, so do we!

: What if (the new Atari) computers were simply modified PCs? You alter the
: BIOS a little, to allow for an Atari splash screen. You have an Atari ST
: emulator that boots first, unless you press a certain key to go into
: GEM2000! And since GEM was originally written for a PC, can you imagine how
: fast it would run on a Pentium-class (Socket 7 233MMX, mind you) system, not
: to mention a Pentium II/III, if optimized? Yee-haw!

I can imagine, since I have run a multitude of emulators. They are not
fast. If you want a fast ST clone, try MagiCMac on a PowerPC Mac. Horribly
fast!

: Sure, you could more or less do that already with a PC today, but assuming
: anyone cared about the BRANDNAME (unlike most people here, it seems), it
: still wouldn't be the same.

It still wouldn't be the same, brand name or not. The fuji sign won't make
the ST PC run any faster.

: We would have affordable, already-made PCBs with all the slots you want. We
: modify drivers to work with GEM for the cards we install and... whoo-hoo!
: We've got Atari computers again, more affordable than EVER, because parts
: are already available and cheap!

Sounds much like the TOS clones we have now.

: The only thing we need to do is modify: the BIOS, an Atari ST emulator to
: work in GEM (or even FreeDOS, if possible), and GEM to work (really fast!)
: on a Pentium-class computer! In fact, if we played our cards right, people
: might ACTUALLY be able to run their apps on both the ST emulator and the new
: GEM! But we HAVE to rewrite as much as possible to optimize it for today's
: PC environment!

Why modify the BIOS? There are a lot of BIOSes out there, and while they
are generally horrible, it would be a lot of work to modify them, and with
PC hardware, you really can't escape the bad qualities of the generic

BIOS.
Your other idea souns good, though. Reminds me of the effort to reverse-engineer an open-source version of the AmigaOS, AROS (http://www.aros.org/), providing full API compatibility. Seeing as the Atari API isn't as complex as the Amiga one, considering the availability of several TOS clones (here referring to clones of the actual TOS, not clone computers running TOS), it should be quite feasible, albeit requiring recompilation of programs unless a 68k emulator were incorporated into the OS design.

: Sure sounds feasible to me and a LOT cheaper than trying to build a custom
: 060 or PowerPC board, plus modify the emulator and GEM to all that stuff.
: Not to mention the drivers... oy!

Drivers would be needed in any case? Do you think they are part of the hardware?

: Now see what you clone-people have done? You've taken me from my grand
: classic Atari ST designs to this altered plan where there's very little
: difference between a new Atari and a standard PC! All in the interest of
: finding some way of getting Atari back!

How about helping the actual Atari scene instead of any of your grand plans? I suggest you go along with the project suggested above, that of writing an API-compatible TOS clone for PCs, and throw your hardware plans out of the window.

Note that on palleted/indexed-color-modes (like the all Falcon resolutions up to and including 256 colors), drawing an all-zero-bitmap results in a white area, whereas on direct-color-displays (mostly 16 bpp and beyond), this will produce a black area, as all-zero means "color with index 0" for the first type of display (usually white), whereas it means "RGB value of 0-0-0" (black) on the second type.

Thus, to fill a rectangular area with all white (or all black), use vr_recfl() or - if you want to fill a memory area only, for later use, use vrt_cpyfm() with a fully filled bitmap (i.e. all bits set) and set the color indeces accordingly.

Ciao

Thomas

The CPU is a 6502 (or 65C02 ?) I think. If you get the Atari800
emulator you'll find there the exact emulation for binary and BCD
including the calculation error the 6502 makes at BCD calculation.
The C source is at the end of file cpu.c and an 68000 assembler
source (partly written by me) you'll find in cpu_m68k.s .
I tested the results against the 65C02 of my Atari 800XL.
If you have further questions feel free to ask :)

Gerhard

So is this an nvdi bug ? The vro_cpyfm should always fill the area with white
when using ALL_WHITE (that is 0) as wr_mode parameter value. At least this
is what is written in my Lattice C manual, and does not speak about color
indexes, will have a try tought, obviously the ALL_BLACK is 1 so I just have
to check....

btw, what's the last version and status of Thing ?

Ok you are right, I exchanged 0 and 15 in the RWHITE and RBLACK calls and all
is correct tought I think would be reversed on a screen of the first type,
where the vr_recfl call shoul work always, I also think there should be no
performance difference, on systems without blitter like MagiCMAc.

THanks again.

It's not a bug, it's a very good example of poor design. I'm afraid you
just have to work around it by using different fillcolours in non-indexed
and indexed modes.

Hi,

One (or two) stupid questions. What is better for Atari (and Milan):
- interleaved format
- planar format
- chunky format
for graphic files?
And how to store then the graphics in memory?

How does one actually use this function call.

My copy of The Atari Compendium says that it will produce a disk IMG file
and is supported by all printer, metafile and memory drivers.

Actually, it "outputs" (draws) an IMG file to an open workstation
(graphics device). I don't know of any VDI function which will
create an IMG file. v_write_meta() will create a metafile.

Or rather just a poor #define for the blit mode.
It should be called ZERO, or something like that.

Even in paletted modes, there is obviously no way to guarantee that
the colour is actually white, since someone may have changed the palette
(in every true colour mode I've heard of, you will get black, though)

>just have to work around it by using different fillcolours in non-indexed
>and indexed modes.

An even better idea (that has already been mentioned) is to use the
functions that are supposed to fill with specific palette indices, such
as vr_recfl().

There is no reason why there should be a difference worth mentioning
even on an ST with a blitter (not to mention any of the faster machines).

I guess Atari's VDI may be slow, but I'd be suprised if NVDI didn't use
some kind of MOVEM loop, which should be within a few percent of what
the blitter can do on large areas (and on small ones there shouldn't
normally be any performance problem in any case). The masking for the
first and last words on each line doesn't take very long.
Apart from people who don't own any replacement VDI, I doubt anyone
makes use of the Atari blitter these days, anyway. You usually turn it
off with NVDI, and fVDI doesn't support it at all.

Machines with decent graphics cards should do a vr_recfl() at least as
quickly as a ZERO/ONE vrt_cpyfm().

What length of warrantee would you be expecting? 90-day? 12 month?
24-month? What kind of warrantee do the people that make the Hades060
offer?

By the way, what is it with hell and demonic creatures that European
countries have such affection for? I mean we have mail daemons, Madusa040,
Hades060, etc. Why? Aren't there any Christians in these countries? Or
are all these countries demon-possessed minons of Satan? :-)

I am going to construct a website dedicated to the rebirth of Atari and the computers it made (and will make, if I and others have anything to say about it!). I'll report when it's ready to visit.

Hi everybody,

Does anybody around here knows what the header of TOS and compatible executables contains, in between the BRA.S +$16 and the "real" beginning of the program?

Let's say that I would like to know enough about this to be able to write an executable from scratch.

See you,

Offset	Size	Meaning
$00	Word	The jump to $1a
$02	Long	Length of TEXT segment in bytes
$06	Long	Length of DATA segment in bytes
$0A	Long	Length of BSS segment in bytes
$0E	Long	Length of SYMBOL table in bytes
$12	Long	Reserved
$16	Long	Program flags
$1A	Word	Relocation table flag ABSCODE. If zero there IS a relocation table.

Program flags:

Bit	
0	Fast load: if set only the BSS area is cleared
1	Alternative RAM load: TT only - if set program is loaded to alternative RAM
2	TT only. If set Malloc is satisfied from TT RAM.
26-31	TPAsize. How much alternative RAM the program considers to be enough to use.

Roger

Presumably the idea is to maintain backward compatibility to existing Atari software, but that means perpetuating all of the mistakes as well. Besides, many of the peripheral chips are no longer manufactured.

To the extent you add new features, or even new hardware, you lose a certain amount of backward compatibility. Eventually, you wind up having to write all of your applications from scratch.

The big question is where to go next. Personally, I am dissatisfied with either Windows, Mac OS, Unix (Linux), Java or BeOS.

No, the idea is to allow people to run their old apps (from an emulated Atari ST) and give a chance for them to port them to the new GEM specification on the new processor (the Motorola 040/060/PowerPC or

whatever). In the end, people will have the same/new apps running on a different/new system made by the revived Atari Corporation, provided we can team together to pull this off.

A dream is only impossible if no one believes in it. No one thought BeOS would have a place, much less survive (or have any place in today's Windows/MacOS mindset), yet it lives, and is known and used by many. Can you imagine what the reaction will be when people start reading in computer papers and online and across every affordable outlet that... Atari is back? I wouldn't want to be standing nexct to the loyalist... I'd get trampled! And, let me tell you, I'd trample myself if I heard such news.

The Alternatives we have today are people's belief that the old must die, because it has, and that we must PC-ify it in order to make it sellable. I don't believe that. I believe you can have the old and make it new and people will gladly buy it. Just because we nay not be able to afford to build the custom chips of old doresn't mean we can't make the same, great all-in-one integrated desgin that once was, and fit it with today's technology. If it's made by Atari, THAT'S what I care about.

Did we care that our ST's were considered far inferior to better Amigas and PC's? No. We held onto them because we liked how they looked and felt and worked. Preference ruled over fact. Just because one computer is better than another doesn't make it better for us and mean we HAVE to own it. As long as oiur systems are supported, regardless of it's technological inferiority, we gladly hang onto it. We're only disbanding because Atari is dead and everyone believes that it's time to move on.

Well, I say... SCREW THAT! Let's band together and prove fate and history (and the Tramiel's, for that matter) wrong! Let's kick the nay-sayers in the groin and march towards our dream! Let us do like Noah did (this is just a symbolic example, not to be taken literally) and do what we know is the right thing, even though others believe we're crazy.

And if we all build the ark together, and get in it together, we can be inside it when the rains and floods of our victory take over the masses. But we remain a victim of history if we choose to believe that history is absolutely unchangable and that Atari is forever dead and gone and that nothing we do or say can ever change that.

Why should the Amiga be the only computer (technology?) that never dies... why can't the Atari Corp. we knew and loved return from the grave? There is no reason at all, so long as be make a decision to make change happen.

You can lead a horse to water, but you can't make them drink. Let's give that horse a REASON to drink the water, eh? :-)

Look around you... there are dozens of web sites dedicated to Atari. Why not start giving them something to REALLY support instead of ghosts of the past? People leave a place when they aren't given a reason to stay (or are utterly forced out)... the party ain't over, guys, unless we stop playing the music! I've got my guitar... if you can carry a tune! :-)

I would like to have a slice of this cake too. Which means that I want a PAL
system, not NTSC!
And, why throw in an nVidia chip? I want a 100% compatible atari ste system,

which means that if we are going to use a faster cpu it has to have a
dynamic clock speed.
The biggest problem would be to reproduce the blitter chip. Since it is
custom made, I haven't looked into it's internals, but probably it can be
reproduced with an fpga or perhaps a micro controller.
If you need help by a systems programmer with a huge hobby enthusiasm for
digital electronics contact me, dholm@iname.com

Get friggin real!!!, what would turning up at my computer club with a Powder
Puff 4000 do to my credability, or even a Loaves and Fishes (2), with Bible
concordance-online bundle, however many 060's its got in it?. 8~)

Put me down for a 4 Meg Gizzard-ripper or a Chainsaw 2 anyday!!.

If we build this system, we will eventually make one for the European market as well, which will mean PAL for all. However, I'm planning on using off-the-shelf chips/chipsets until the company (or Atari itself, if we can ever get it back) has the finances to build custom chips again (which I would just LOVE!). The most important thing is that we're working to get back Atari as a computer company from Hasbro and all rights therein. They can keep the game software rights, as that's all they're using right now anyways.

As I wrote to someone via Email:

This isn't a job for people who don't care. Hasbro obviously doesn't care about Atari except for the namesake and software titles, as we've seen recently. No, what we have to do is start a company, make an "Atari" system, get people to buy it, write/port software for it, and then, with enough financial backing (I'm guesstimating possibly $1 million or more), we approach Hasbro and ask to buy back the rights to the name and properties of Atari as a computer manufacturer. Hasbro hasn't done anything with it, so

why not sell it to someone who CAN! If we succeed at this, we, as users, will own/run Atari! Just the way it SHOULD have been since the beginning. Afterall, who knows better what WE want out of a computer/company than WE do, hmm?

If anything writing-wise is to be done, we need to find out what procedures and expense would go into buying back the rights to the name/properties of Atari as a computer company. Hasbro can keep the game software title rights... we couldn't care less. We just want the company/computers back, right?

I'm working on putting a website together to support this (deemed probably impossible by many) dream. However, if you have the resources to do so (i.e. do the site yourself), I will show you my statement to the Atarian public I've written up to be shown on that page.

Sounds like you're with me on this... are you? It will require many users, enthusiasts, developers (hardware/software) and financial resources to build the company and the computer to which will give us the leverage we need to convince Hasbro we mean business about getting Atari back.

Unless someone has a few $million$ laying around and wants to simply engage Hasbro in an outright buyout of the Atari company rights. Money oft talks real fast and easy... But we still need more money after that to build the new Atari systems... so, even that isn't the simplest route, though it would be the most direct. :-)

Do you think this is a good way to go about this or do you have a better route in mind? And, most importantly, do you believe (as I do), if enough of us team together on this, we can actually pull this off? This is not some "Gee, I sure wish...". This is a "If we get together on this, we're gonna DO IT!" I've done the wishing (Atari was still alive, I ran Atari, Atari had done things differently, etc.) game since Atari died. I'm tire of it and ready to actually DO something about correcting the past and building a new future!

So, talk to everyone who will listen! Go to every site you can! Grab every willing volunteer! Take down names and faces, men! It's time to take back the company that rightfully belongs to it's followers! C H A R G E !!!!!

I don't know what medusa offers, I never bothered to check as the
over-seas order idea don't sit well with me. I suppose 90 days
would seem fair, as long medusa's is at least that long.

It occured to me many times that hades has been around for quite
some time. As far as I can tell everyone who has one is very
happy, in fact refuse to re-sell them to me if I ask. It also
appears to be well support as far as clones go. Why not put
the effort into supporting and importing this machine?

It don't come with magic or mint, so it don't upset either
camp. You decid that when you get it. All it really needs is people

to write drivers for some of the newer cards out there.
I could kick myself for missing the chance to get one when
it was available over here in the US. I just don't think that
we need another clone with another design, unless you intend
to duplicate the custom chips.

It's a very good way to sell a new computer IMHO. By packaging MagiC along with
a selection of MagiC-friendly software they can be sure that the buyer ends up
with a compatible system out of the box. Saves a lot on after sales service.

Here is some C stuff I found in "Atari Profibuch ST-STE-TT".
Only the MultiTOS/MiNT extension is missing (memory protection flags).

```
typedef struct
{
     WORD ph_branch;        /* Branch to the beginning of the program (0x601A) */
     LONG ph_tlen;      /* TEXT segment size */
     LONG ph_dlen;      /* DATA segment size */
     LONG ph_blen;      /* BSS segment size */
     LONG ph_slen;      /* Symbol table size */
     LONG ph_res1;      /* reserved (perhaps it's used for MultiTOS??) */
     LONG ph_prgflags;  /* special flags (fastload, malloc from TT ram) */
     WORD ph_absflag;   /* 1 means: no relocation data available */
}PH;
```

Program file components:
 * Program header (PH)
 * TEXT segment
 * DATA segment (if not 0)
 * BSS segment (if not 0)
 * symbol table (if available)
 * relocation table (if available)

Good luck
Philipp

I see how that could make Milans after service easier to maintain, but I
still think it is unfortunate that the buyer is forced to buy a
MagiC-system. Milan did have NAES as main on before, so it seems to me
like if they would not have all that much trouble allowing their
customers some choice when it comes to the OS.

As far as software compatibility is concerned I think that serious
software should be both NAES and MagiC compatible all the way where
possible. (at least when it comes to commercial software, but I also
think this platform is getting too small to have people writing OS/AES
dependant programs when they should be able to keep them working on more
than one)

I also guess most Atari users that still are around would not be in need of support very often since they tend to know their stuff pretty well.

This really should go to the advocacy newsgroup...

Personally, after using it for almost 3 months, I am very happy with the way Windows 2000 integrates everything: mail, browsing, different networks, word plug-ins in Explorer, etc. The only drawbacks are: insuffificent and improper Ethernet routing and, surprise, surprise, a Word 2000 that is even less stable than Word 97 ever was. In other words, the OS-level integration of several key features is awesome, but the weak components is not.

Mac is even more attractive than ever. Both the look and the feel are in the great tradition of bringing a computer down to the simplicity level of a toaster, with great, compact space-age hardware designs. Their only drawback are: price, availability and support. I can go to any convenience store and find printer labels that come with their own Word template on a floppy. Mac templates are just not there.

Linux is fun to use, once you figure out how to use Dselect.
The only annoyance, so far, is the incomplete support for some
older hardware. Otherwise, things are progressing rather well on
the user-interface level and ease of setup.

BeOS is really tempting, as many graphics and music software
companies are porting to it. All the code compatibility of Unix
under the hood, hidden behind a cutesy user interface. Yummy!

Please check the site of Rodolphe Czuba.

Rodolphe already has the hardware part covered and ready to ship.
It's called the Phenix. What he needs (which has left him) is a
programming team to port The Operating System to his hardware.

Sorry, I don't have his URL handy, but you should be able to find
it using Metacrawler.

You are aware that NVDI basically replaces the blitter chip?

 I really don't like having to buy for a OS that I'll throw away as soon
as the machine arrives. I think that it should be optional what OS you
want NO OS at all. This way they could sell it with MagiC to newbes and
without OS to me, so I could install what I want :)

This is becoming one of those "Is this Pentium Linux-friendly and
does it sell with Red Hat pre-installed? No Windows here, thanks"
kindof thing... ;-)

Hi!

Martin-⍰ric Racine <q-funk@funkyware.atari.org> wrote:
> Linux is fun to use, once you figure out how to use Dselect.
  ^^^^^^   ^^^^^^^

You're obviously speaking of Debian/GNU Linux here. Almost all distributions come with their own installer / packaging tool, dselect just happens to be the one for Debian/GNU Linux. Thus, understanding dselect isn't necessarily crucial for using Linux.

Of course, for Atari hardware there are (to my knowledge) only Debian-based Linux distributions, but as you've already written about Win2k and MacOS above, I don't think you were just talking about Linux for Ataris.

Ciao

Thomas

I tried Linux on the TT once. Horrible!

Now if you want a 100% STE compatible system, that means you need:
- an original 68000 CPU - no 020, 030, 040 or 060, since that breaks compatibility with some programs.
- a video system that is compatible at register-level, which means you can't have higher resolutions or more colours without breaking compatibility.
- an ACSI port, plus a compatible replacement for the WD1772/Ajax floppy controller which is no longer in production.

All this will severely limit your design - but what do you gain by aiming for 100% compatibility? A machine which *is* some kind of befed-up STE, nothing more.

>The biggest problem would be to reproduce the blitter chip. Since it is
>custom made, I haven't looked into it's internals, but probably it can be

Doing a blitter of this kind in a modern FPGA is no big problem. However, you can probably get a ready-made graphics controller engine with integrated RamDAC, a 2D/3D engine which can do a lot more than the blitter, and without any design effort, for less money.

cu

It would be great to have the Hades060 being sold here in the US. It would be even greater to have a more upto-date machine. By that I mean a Hades060 that had a speed of 80mzh, DMA sound, better PCI BUS (more standard with the rest of the world), USB port and more. I cannot understand why Medusa Systems has not done this. Oh, I forgot to mention the caching concerning the SCSI port. Get rid of it.

No I'm not. NVDI, do you have a datasheet or url? Is this 100% blitter
compatible?

I get your point. And of course you are 100% correct, I would be better to
make it a whole new atari.
Then the big question is, what do we want to keep from the old atari, and
what do we want to replace?
Neither the original blitter or the YM2149 would make it in todays market,
and if we remove those (especially the YM2149) would it still be an atari?
One of my fondest memories from the atari is the sound of the synthesizer.

Which is probably a much better idea from all angles.

Still, I want to be able to play my old atari ste games on this machine
(very much like I can play my old 286 games on my 686 system (this can be
discussed though ;))
Then, could we maintain at least some backwards compatibility by using a
newer 680x0? (I have never studied any of those architectures)

Yes, I'm interested, write me up as Systems Programmer/architecture designer and contact me by e-mail (preferably) when you get things going. (I'll try to monitor this thread as well)

NVDI is software - it replaces and enhances VDI (NVDI supplies a GDOS,
vector fonts, functions for bezier curves, enhanced colour bitmap functions
etc.).

And even on a normal, unaccelerated ST, it is faster than the ROM VDI with
the help of the blitter. On an accelerated CPU, the blitter falls back even
more.

We couldn't use MagiC if we want to make a new architecture (although
somewhat atari-like ;). The best thing would be to write a new OS (a
GEM-clone of course), and put it on a flash-rom, that way it could easily be
upgraded by using software. (The question arises though, perhaps it would be
MUCH smarter with a bios on flash rom and the os on the harddrive ;).

Hm - I always thought about the ST in terms of software and operating systems. I always thought of the YM2149 as a way to produce the system beep, nothing more. For good sound, use digital sound (like the DMA sound on STE/TT;Falcon).

Difficult. Even the 030 breaks a lot of programs that were not written with portability in mind, and the 040/060 are even worse due to improved caches.

You have two options: either a very compatible machine, or a really new, improved one that runs TOS plus all clean applications on a hardware that is a complete redesign.

When we designed the Milan, we decided to go the second way - if you want compatibility, use your old STE to play the games on. By not having register-level compatibility for games, you gain a lot of freedom in design decisions.

That's what we're after... a brand NEW Atari computer, but made BY Atari.
Aye, there's the rub... and it sure feels good! :-)

Without Atari Corp. all Atari clones are simply hacks to keep the dying

from utter death. What we propose is the restoration of Atari Corp. itself (in the US first) and the design of all-in-one systems like before... except a LOT better!

Atari Phoenix (not Phenix), anyone?

It might take millions of dollars, but if we believe in the dream enough, those millions aren't such huge numbers, because we're ready to fight the "Giant of Impossibility". Are you?

Keep: TOS, MiNT and GEM as OS, and m68k as CPU architecture.

Germany is a better market and better place to start it, if only
because of the _huge_ competence.

Do remember that while the Tramiels could not make their mind
about what to make of Atari, the president of Atari Germany saw
the potential and hired several sub-contractors to develop
solutions and port Unix, etc. which is how the Riebl Ethernet
card for MEGA and TT saw the light.

Build what you will, but I will still buy a hades060 if it
hits a dealer over here. Maybe I am bias, but I love my TT
so a hades060 makes sense for me. ;-)

But if you have a 68000, you need an MMU, which increases the overall
cost/complication of the system. Would the 68060 get confused by the extra
MMU, since it has it's own, or...?

The thing I'm wondering is... can you have a dual 68040 or 68060 system and
then address/access data 64-bits across, allowing the use of DIMMs, instead
of 72-pin SIMMs for memory? Can you use SDRAM? Things of that nature...

What causes the blitter to slow down? I have noticed on my Falcon it can be quite slow...

Why not use 2 cpu's, it wont be expensive to slap in a 060 and an 000. Just
make it possible to switch. Same with the yamaha. Also I remember the
Phantom talking about using a PIC, or Custom DSP to replace the ajax. All
very possible...

>I need to know...

At this point, I'm a dreamer. If you're going to come

up with a new machine, it has to be forward-looking to
have a chance to survive and grow.

Other thoughts:

Generally, my suggestions spring from the following desires:
** Make the programming easy for the new programmer. That's
what got the early computers going, and that's what we need
to keep TOS/GEM going. That means clear documentation
with LOTS of examples!
** It is necessary to keep the computer experience as simple as
possible. The original ST, for example, could "sense" the
attached monitor as either "monochrome" or "color" without
requiring any adjustments by the user.
** Expandability is important, whether it is supporting a ludicrously
large amount of RAM, or providing daisy-chainable ports (such
as RS-485 or that new one they're using on the IBM/clone
platform).

Other thoughts:
** To stand out, the computer must do one thing VERY WELL, and
I think the built-in video-wall support will easily set the
machine apart from others, even if only 1 in a 1,000 customers
actually uses the video wall feature. In the past, people
associated the Atari with MIDI and music, the Amiga with the
"video toaster", the MacIntosh with "creative types", and clones
of the IBM-PC with "business". The Milan is aiming to be an
"Internet Appliance", the Amiga is currently down for the count,
so video applications look like a good area.
** Don't limit yourself to video, either, since the DSP-equipped
Falcon heralded the era of sound editing as well. Consider the
need to make TV commercials ... or complete features ... business
multimedia shows ... Music CD mastering ... animated shorts ...
visual training manuals ... live security systems with data
logging ... multimedia web pages ... there's a lot that needs
to be addressed!
** And how about some video peripherals? How about a VCR
designed to be controlled by computer? That would be
another use for the RS-485 port -- but you'd need a VCR that
supported the port and acted upon the commands received. And how
about an AM/FM tuner that is controlled by computer input, as
well. Why ... you could have a computer-controlled home-theatre
experience! And if not a complete VCR, how about a way to plug
in a camcorder video tape into the computer for direct
control/view/editing by video software?
** Don't forget the other purposes for computing: Word Processing,
Spreadsheeting, Databasing, Internetting, etc. But do one thing
extremely well.
** Multiple RS-232 port support (mentioned previously) is a nightmare
on the IBM PC, and is ignored on other machines. Providing OS
support (and back panel connectors) for 4, 8, or 10 simultaneous
serial connections will be an eye-opener. It could easily be used
as a "poor man's" networking method, or a "data concentrator" that

monitors 8 external instruments/peripherals from a central
location.

Actually, I kinda like the idea of a twin-processor system: 68000 with ROM TOS for compatibility purposes, and a 68060 -- or, even better, a pair of 68060's with flash rom OS -- for power users. You could add a new XBIOS function to the 68000's TOS (a function called during the power-on self-test) that performs a checksum on the 68060's flash rom on startup, taking over if it finds corruption. It would have the NEW ability to reprogram the flash rom from floppy / CD / the Internet. Without corruption, the 68000 would recognize a good checksum and allow booting to continue as specified in the startup sequence to run with either the 68060/flash system or the 68000/ROM system.

Heck, why not FOUR sockets for 68060's? Ship the basic unit with one 68000 and one 68060 and allow the OS to detect and support additional processors as they are installed. What's the fastest 68000 available these days, anyway? Could we use the same 80 MHz clock on both chips?

One does not really need much more than this:

* Base10/100T Ethernet
* MIDI ports (in/out)
* RS-232 (DB-9, SCC-B)
* RS-422 (LAN, SCC-A)

Modem1 compatibility could be handled by software and forwarded
to the ESCC as Modem2. It's actually a very good idea to use an
ESCC, because it maintains backwards compatibility with previous
Atari practices for the MEGA-STE/TT/Falcon for LAN/Modem2, but it
is a much more reliable chip and still available.

Here's one way to maintain compatibility for relatively low cost:
Get a VMEbus card cage, put a STE clone on one card, and use other
cards for improvements. Everything except the STE card can be
bought off the shelf.

The question is just how many other chips are needed, which depends
on how much software you want to maintain backward compatibility
with. The MFP and sound chip were used for a LOT of things not
supported by the OS.

it does not slow down, but with a faster CPU, the relative factor between
CPU and blitter increases.

So yes, with a faster CPU, the slowdown expired by enabling the blitter is
more noticeable.

What for? Those few programs that absolutely require a 68000 are best run on
a 68000 machine - ie. an old ST, which is available cheap/free.

Thanks. But when I tried it nothing happened for the next fifteen
minutes and then I gave up ?!

So what I did was :

1. download xx.rpm
2. since rpm didn't work I tried :
3. rpm2cpio xx.rpm > xx.cpio
4. cpio --extract --make-directories xx.cpio

Any ideas ?
Gerhard

Hi,

Rafa? Kawecki a ?crit:
>I'm looking for C (PureC) sources to show GIF and JPG files.

This is not exactly what you are looking for, but you can use
my lib "RIMM.LDG" (RIMM=RIM Manager). RIM are plug-in to Read IMage.
There is a RIM for GIF, another one for JPEG (very fast), and much more.

this is a LDG (Dynamique GEM library) which works well on
TOS/MiNT+NAES/MagiC... and you can use it with PureC, GCC, SozobonC
(i use sozobonx), GFA basic.....

You can download my programm RIRI2 from here:
http://perso.wanadoo.fr/arnaud.bercegeay/load_e.htm

This small programm just load a picture (using RIMM.LDG) and
display it in a GEM window.
the displaying/dithering/resize functions are done by SCREEN.LDG
so that it should work on all graphics cards.

All you need to run riri2 is in the zip file.

For now, most of the documentation is in french. If you have some
trouble with it, email me !

Bye,

Here's a list of some Atari ST stuff for sale. If you're interested or want
to know more, contact me, Steve, at power@atarist.com

I've given you the prices but you'll have to add postage to this... (I live
in London)

* * * * * * * * *

Atari 520STFM + owner's manual + mouse £10 (occasionally slightly temperamental but not a big deal. Sometimes the power cuts but just give it a little tap & it comes back on!)

Epson LX-100 dot-matrix printer. Excellent condition. £5

Joystick/mouse extension lead £1

Powerplay cruiser joystick. Good working order. £2

Master Sound Sampler (incl software & manual) £5

ST Basic Sourcebook and Tutorial £1

Atari ST Internals - The Authoritative Insider's Guide 500pp (Abacus Software) £3

HiSoft DevpacST 2 version 2 (including manual & pocket programming guide) £2

GFA Basic System 2 (including manual) £1.50

Atari ST original disks (£0.75 each unless otherwise stated) (* - includes instruction booklet)

Ranarama
Rampage/Wizball*
ST Basic
Oriental Games (2 disks)*
North & South*
Last Ninja 2*
Overlander*
Netherworld*
Zynaps*
Space Harrier (2 disks)*
Kick Off*
Ghouls 'n Ghosts (2 disks)*
R-Type (2 disks)*
Interphase
Enduro Racer*
Nebulus*
Silkworm
Star Wars*
Speedball*
Archipelagos*
Barbarian*
International Karate Plus*

Copied software (which is now LEGAL!) - £5 the lot

Hi,

I'm working at a GNU project and have the problem, that my environment generates other .o files than the one of other people working at the same project (a800 emu) and the result of my compilation does not work while the others do. For the Atari platform we agreed on GNU C 2.91.66 and GAS 2.9. The first things when we tried to synchronize were bin/gcc and bin/gas where I gave up my slightly newer versions. Then I took over the include directory. That too didn't help.
Does anybody have an idea what other files would be needed for exact synchronisation so we could be sure to create exactly the same programs ?

Thanks
Gerhard

Same compiler, same binutils, same libraries.

Sorry about that last one. Haven't used Newsie before, but my
old Fidonet access doesn't work anymore.

I'm playing around with pseudo-random number generators, and
was thinking it would be a good idea to save the Random() seed
in NVM (non-volatile memory). That way you would get different
random numbers each time you boot up.

I can't find any info on which (if any) bytes in NVM are unused.
I dumped it, and found nulls in bytes 0-5, and several byte pairs
containing 0x123 scattered around. Anyone ever hacked into the
NVM before?

In a recent email conversation with someone, I was informed that Pure C has problems with data initialised at compile time.

The example they gave was

[quote]

```
typedef struct
{
  char one[10];
  char *two;
} FOO;
```

then the declaration

```
FOO s = {"foo","foo"};
```

doesn't work for s.two; it works for s.one, though. The only way to set s.two to "foo" is to explicitly assign it to the string, i.e. s.two="foo"; But this can only be done in a function.

[end quote]

Are there other compilers that suffer from this problem?

As my Toolbox DLL engine requires libraries to have a data structure defined and initialised at compile-time, this will make it difficult to write DLLs in Pure C, for those with that particular compiler.

(I am also told that the startup code is not supplied with that compiler, nor is it replacable)

How can I detect something compiled with Pure C, so I can act accordingly?

Or will I have to disallow Pure C as a DLL creation source?

Current MiNT version have a so called random device (/dev/random) there
you can read real random numbers (calculated from interrupts, keyboard
events and so on).

Hi!

Frank Naumann <fnaumann@freemint.de> wrote:

That's correct, but even with /dev/random you need a way to preserve the
entropy pool across reboots - otherwise, you'd have to wait quite some
time after each reboot before enough events have been collected to
generate secure random numbers.

And that's also necessary for /dev/urandom, even though this one only
generates computationally secure random numbers, because without a
random (enough) seed, any PRNG will spit out predictable numbers.

Usually, that preservation is done via a script that saves the current
state in a file and restores it on the next boot. The NVRAM won't be
suitable for this, anyway, as you'd have to store 512 bytes(!) of random
state information for /dev/random.

Ciao

Thomas

I have many docs, even an actual Atari devkit and that
information was not given out and/or documented. There some
programs that deal with NVM, perhaps these would give clues?

ohh... has it ?? I didn't remark this till now... I will test it...

> (I am also told that the startup code is not supplied with that
> compiler, nor is it replacable)
That's not true. The startup code can be exchanged with a custom one.
For example PCMXSTRT.O I found in the MagiC Library. Just replace the
old PCSTART.O in the project file. Or write a own file. There aren't
any limits!

> How can I detect something compiled with Pure C, so I can act
> accordingly?
The macro __PUREC__ is defined.

> Or will I have to disallow Pure C as a DLL creation source?
No... please not. PureC is a good and stable programming environment.
There are lots of people who use it even today! (Me too)

Greetings
Philipp

Even better: The source of all Pure C's startup files (pcstart.o, pcxstart.o, and pcvstart.o) is included on the install disks, so you can even modify the existing ones to remove the bugs they have.

Ciao

Thomas

Oops. If you try to get more than 48 bytes back from NVMaccess(),
you get nothing.

It appears that only the first 18 bytes of NVM are used. For the
curious, on my computer they are:

$0,$80,$d,$41,$44,$4,$5,$44,$50,$10,$41,$4,$24,$0,$5,$4,$0,$90

followed by nulls.

The memory address that identifies which Basic that you have is 43234.

So when you start your Atari up, at the READY prompt, type in this command:
PRINT PEEK (43234)

You will get a value of 162 if it is Rev A Basic.

You will get a value of 96 if it is Rev B Basic.

You will get a value of 234 if it is Rev C Basic.

Amateur Atari historian and Devout Atari game player,
Wally

If memory serves, the TJPEG component for Borland C++ Builder comes
with full sources - iirc only the wrapper code is in C++ - the "jpeg"
stuff is in C.

That's great to know.

What initialisation does it do? (I've never seen/used Pure C - I do my development in Lattice C v5.60 and Devpac 3.1 assembler. Prior to that I used Megamax C and Laser C - IIRC all of which supplied startup code which could be altered)

Will it go crazy if one replaces the startup code with a simple "jmp LibInit" assembly instruction?

My DLL manager [called "The Toolbox"] is nearing a releasable state - complete with the 391 yet-to-be-discovered bugs and 27 inconsistencies. :-) Hopefully it'll be useful/usable after the 8 years I've spent developing it. All it requires is 32k RAM for itself, and AFAICT, it works well with MINT, but it isn't required.

After it has checked that the library being loaded is actually a Toolbox library (a structure must be defined at the start of the initialised data segment with known constant values), it does a subroutine call to the beginning of the text segment, which is assumed to be the LibInit function, which will allow the library to initialise itself, and check that the Toolbox version loading it is correct and return a success/fail code to the Toolbox.

(Normal startup code AFAICR, will parse the command line into argc and argv, setup internal buffers call main() and then do a GEMDOS Pterm() which makes it unsuitable to use as library startup code)

That's great to know.

What initialisation does it do?

If it's like other C compilers it will generally parse the command line into argc and argv, setup internal buffers, call main() and then do a GEMDOS Pterm().

(I've never seen/used Pure C - I do my development in Lattice C v5.60 and Devpac 3.1 assembler. Prior to that I used Megamax C and Laser C - IIRC all of those C compilers supplied startup code which could be altered or replaced)

Will Pure C go crazy if one replaces the startup code with a simple "jmp LibInit" assembly instruction?

My DLL manager [called "The Toolbox"] is nearing a releasable mid/late beta state - complete with the 391 yet-to-be-discovered bugs and 27 inconsistencies. ;-)

Hopefully it'll be useful/usable to others after the 8 years I've spent developing it. All it requires is 32k RAM for itself, and AFAICT, it works well with MINT, but doesn't require it.

After it has checked that the library being loaded is actually a Toolbox library (a structure must be defined at the start of the initialised

data segment with known constant values), it does a subroutine call to
the beginning of the text segment, which is assumed to be the LibInit
function, which will allow the library to initialise itself, and check
that the Toolbox version loading it is correct and return a success/fail
code to the Toolbox so it can either continue/abort the library load.

The command line parsing and especially the final Pterm() make normal
app startup code unsuitable to use as library startup code

hi,

To my surprise, I came across a very old (nov. '89) review of Borland
Turbo C 1.1 for Atari .. .

Anyone ever encountered it ?

Hi !

It seems that Pure Software bought the license for the standard C librairies
from Borland.
So you can see Borland on Turbo C for ATARI (note that Turbo C was also the
name of one of the first Borland C compiler on PC)
After, Pure Software decided to call it "Pure C", but the standard
librairies are licensed by Borland.

See you, Jean

Ok, we all know that Atari is dead and gone, right? The Tramiel's killed the company outright (and after saving the company too! *sigh*). All it is now, is a brandname for Hasbro and their PC game packs. Sad, isn't it?

Atari technology is dated in the extreme. No support from Atari (gee, I wonder why?) and 3rd party companies have all but dried up and gone elsewhere or died out completely.

But I have always wanted to see a computer made that was the BEST it could possibly be. Think of it as the Atari ST on Mega Steroids!

Never gonna happen, is it? Well... not unless a few (or more) determined Atari ST programmers, enthusiasts, and technical types team up and help make it a reality.

While we can't bring Atari back from the dead... well, we *might* be able to in the future, if we play our cards right today... we can create the fresh beginnings of an Atari system revival in the form of a new system!

Think of it... GEM has been GPL'd. If we build a system, based on the 68040, that runs a classic Atari ST (68000) emulator in ROM, while a second EEPROM (containing an updatable version of GEM) contains "GEM2000" or whatever, programmers and developers can slowly port their ST apps to run on the 68040 for GEM2000.

With enough support from end users, developers, programmers, and a licensing agreement from Caldera (concerning GEM), we might just be able to revive the past into a new future.

With enough financial resources (from sales of this new system), we *might* be able to buy the company hardware rights to the Atari name from Hasbro, thus restoring the Atari computer hardware name and bringing basck Atari as a brand that sells computers again!

It may seem far-fetched, impossible, unlikely, or just plain foolish, but think about this:

People believed that Windows and MacOS were the only choices and that making another OS would be utterly foolish... along comes Jean-Louis Gassee.

But it ISN'T an Atari! It's a patched-together "we're building them to
support the dying Atarians" effort. And, it's in Germany, not the USA. I'm
talking about reviving the Atari brand in the US!

That would be nice, I'm all for that - if we're still allowed to buy
American computers this side of the pond by the time you get it built.
We're being invaded by European legislation at the moment. They've
taken away our inches, feet and pounds, and are forcing us to use some
weird things called metres and kilogrammes. Now they want to stop us
having our own money and use Euro-money, and are trying to force big
American cars into the scrapyards by whopping up the taxes. I can
see them objecting to us using American computers next... but I digress,
my STe is painfully slow on the internet and I want a replacement
(but not a PC) - so get one built quickly! Meanwhile, I'm off for a
drive in my Dodge while I still can!
Gary.

Actually, from the looks of it, Milan Computers, I think, owns the rights to TOS. Unless their English is mixed up in some way. Thus, reviving the Atari brand name in America might be more difficult, especially if it uses the same OS... but... if it phased from the old into the new (something still all-in-one integrated, like the ST/TT/Falcon has, but much more powerful), using my ST emulator in ROM concept...

But if this is going to work, we need to put together teams of people willing/able to make it happen. Unfortunately, I'm little mroe than an idea man without even the money I used to have to make things happen. Married life seems to have depleted my reserves for some odd reason... :-)

But it all has to start somewhere...

We need:

->Programmers to look at GPL'd OS's like CP/M-68K, GEM, FreeDOS, MinT, etc. An OS that isn't in common usage today. To that we would add a new GUI (I can work on the art/graphics/functions for that) and work on porting it to the 68040 or improving it to work better on such a processor.

->Enthusiasts (people who are still die-hard Atarians who still own them and use them regularly) to buy the system.

-> System designers to help draw up schematics of what the system's motherboard will look like with all the parts integrated.

-> People with money to help finance this whole deal and start a US-based computer company that will (hopefully) become Atari once again.

From what I've seen, the Milan040 "Atari ST" computer is a serious hodge-podge of PC motherboard design, mixed with a 68040 processor and a mutant TOS. It may look like it's an Atari onscreen, but I think what they've done is taken the corpse of the Falcon030 and thrust it into the vile den of PCdom (slots galore with all the compatibility issues (is this or that card supported by MutanTOS?) and plain motherboard ugliness and a

tower case. Not how I envisioned my future Atari to look/act at all.

I think no matter what you do there is always going to be some
level of "patched-together" as you put it. No one has the
back bone or possibly the resources to design or redesign
custom chips and that is what made the Atari somewhat what
it is. It's is far to easy and cost effective to retro fit
some current card slot (PCI) and such into a clone.

You know ... if you were the designated US Importer
for the Milan 040 / 060 machines while working on
your project, you'd have a fairly good stream of
income for awhile. And if you pushed the Milans
REALLY HARD from an advertising standpoint, you might
even get past the purists to the home users who are
unhappy with Windows but are trapped in the
"compatibility" mindset.

It would be easy to build a base that way, then
"upsell" to your fully developed machine when it
is ready in a couple of years. Even home computers
are expected to be networkable, both with LANs and
the Internet, and that is likely to take a lot of
development effort right there.

I know I'm going to get a Milan II ... I've promised
myself I'll get one ... but I'd like to buy one from
a US dealer (like chro_Magic, for example) -- but the
dealers need a US Importer to handle them.

I've been giving your post some additional thought,
and it seems like a bit of study of the capabilities
of GEM might be in order to ensure a truly amazing
machine.

------- Thought Number One: Video Screens ---------

For example, the ability to open multiple workstations
means built-in support for multiple monitors. One
computer could support two real-time screens, either
side-by-side or one-atop-another to provide expanded
desktop space ... or two independently-running applications
(an excellent capability for a multitasking machine).

But there's no need to stop at two, when you could have support built-in for a 2x2, 3x3, or 4x4 video wall. A few tweaks to the AES and you've got a feature offered nowhere else -- but remember to put some monitor connectors on the back panel for easily implementations! For starters, I'd shoot for support of four simultaneous monitors but would allow for expansion to 16 (i.e., the 4x4 video wall).

------- Thought Number Two: Mouse / Keyboard ---------

A quick look at the hardware shows the keyboard has been implemented as a stand-alone subsystem that plugs into the motherboard as a peripheral. The keyboard also supports the mouse and joyport.

Considered as a subsystem, you could easily build in the availability of additional keyboard/mouse combinations. Combined with the multiple-monitor support (above), you've suddenly got multiple workstation support on one computer. Great for data entry, web surfing (imagine it's use at a Cyber Cafe!), and perfect for gaming where each player has a set of controls!

Assuming support for four monitors (above), I would suggest built-in support for four /additional/ keyboard/mouse peripherals using a 4-wire daisy-chaining interface such as RS-485 (capable of supporting 31 unique devices using a connector that looks suspiciously like a telephone "modular plug"). The main keyboard would be reserved as the "console".

That would mean a built-in keyboard/mouse/joystick and four plug-in keyboard/mouse/joystick peripherals.

Getting excited, yet? Good thing we've got MiNT available to handle multiple users.

------- Thought Number Three: New AES Calls ---------

Although Atari did upgrade the hardware, the AES portion of GEM (the windowing part) did not receive the additional calls needed for robust support of it.

There has long been a need for joystick and joypad support!

EVNT_jstick( ) and EVNT_jpad( ) would be welcome, as would an update to EVNT_MULTI(... jstick ... jpad ...). Matching VDI calls that would "sample the state", "wait for input", and "wait for change of state" of the joystick and joypad ports would be welcome.

Naturally, there's more that's needed. But this gives you the idea.

Take some time to examine the VDI and AES calls and
you'll see many hints about the unused capabilities
of the OS (... such as a 16-button mouse or ten
simultaneous RS-232 serial ports) that could be
exploited fairly easily on your new machine.

A look at history shows that Atari just threw the ST
together and got it to market as quickly as possible.
Now is the time to sit back, look at what GEM is truly
capable of accomplishing, and give it the hardware that
will cause it to sparkle and shine.

And when you're done, it will be leading edge. Again.

If I remember correctly, QNX (with Photon GUI) which networks
so easily that other machines are practically seen as an
extension of memory and other resources of the controller,
can support a screen with resolution of 32768x32768 pixels.
This "screen" can be distributed on several computers with
their monitors and you can, for example, drag an open window
from one monitor to another.

Btw. QNX (being small, fast, reliable and free) has recently been
suggested in comp.sys.atari.st as a possible new kernel for
Atari (clones) OS.

Now THAT is the kind of enthusiasm I'm looking for! YES! Not just the
ever-popular "Little Red Hen" scenario (they wouldn't help with planting,

watering, weeding or harvesting the wheat or making the wheat into bread, but oh... when it came time to EAT the bread, they were all there at the door)!

Do you have the skills to pull this off or are you simply knowledgeable in GEM, in general, and are only offering up suggestions for a potential programmer?

I need to know...

Besides, what better victory can there be when the enemy thinks you're dead and you end up sneaking up from behind them, tapping them on the shoulder, and smacking them upside the head as they turn around to see who it is! I would LOVE to see the look/reaction on people's faces when/if Atari is reborn making computer's again.

And think not that the 040 is the end... oh, no... I plan for the 060 model and then the PowerPC (or whatever is the next step up from the 060) models and on into what the future may hold! From the beginning it was Motorola and it can be again!

The Milan040/060 is, to me, nothing but a PC pie with an Atari crust... and from the look of it, they're trying to wean away from what Atari part is left in the Milan060

I would very much like a contact address at Hasbro. Repeated
e-mails to them, trying to secure a TOS 3.06 license, have not
been answered.

Now, why does it matter where the machine is built? As long as the
machine is available in the US as well, there should be no problems.
It's obvious that the Milan 2 is available in Germany first since the
Atari ST sold here well and has many professional users.

Greetings,
Matthias.

the US as well, there should be no problems.> It's obvious that the Milan 2
is available in Germany first since the> Atari ST sold here well and has many
professional users.Agreed, the location of the manufacters should not matter.
But of courseit would be cool to have the brand Atari revived! :) I think
biggestdrawback with Milan is that they only sell it with MagiC these
days.Sure one could buy NAES separaytely but you are still paying for MagiC.I
have nothing against MagiC really, but I would not want to pay for itif I
decided to buy a new atari clone if what I really want to use is
NAES./Joakim-- WWW: http://gokmase.atari.org

Hello,

I'm looking for the sources of the standard lib
XDLIBS 1.13 for sozobonx c compiler to fix a bug
in that lib.

    IIRC an AC_CLOSE message is sent before accessory termination. However for pre-3.00 TOSes memory allocated "by the accessory" (in fact wrongly and automatically associated by GEMDOS with the at-that-time active application) may have been already unallocated... so on these TOSes the only way to cope with this AFAIK is to patch the _p_run variable...
    Oh and I think (correct me please if I am wrong) that accessoiries never get AP_TERM messages.

Hi,

In case anybody else had similar problems and didn't find what's
wrong :

Last weekend I tried to use devpac3.10 on files that are on a ext2fs
partition. When it tried it via command line I got errors from devpac
that it can't find include files. Then I tried it from the devpac
shell and couldn't even load the source file.
When I copied the sources to a minixfs partition and tried it there
everything worked.

Gerhard

Hi,

Is there anybody else (except Petr Stehlik and me) who tried to

compile the Atari800 emulator source ?
I would be very very interested in any experience/troubles encountered
with description of the environment that's been used.

That's because ext2fs doesn't support the old API, it will only work with
MiNT/MagiC-aware programs.

Well I did not compile the source, but used the program for the TOS computers on my Hades. Actually it runs well and plays just like an eight bit computer as far as graphics and speed. The thing where it falls short is the sound, but it is not the program's fault. The Hades does not have DMA sound, but uses the same soundchip as a ST. I know, kind of dumb.

Anyone know where I can get a copy of ST Basic for use on the WinSTon
emulator? I've searched all over the net but can't find it - it surely
can't still be in copyright - can it?

Hi

Well I haven't heard of it being released as public domain. I do have a
copy for sale if you want, £5 + postage.

Then you can use the image with a clear conscience:)))

Hi,

Some questions :

- I sometimes use devpac and gst2gcc to create .o files to be linked
with gnu object files. Is this still possible with 2.95.2 ?

- I heard rumours that FreeMiNT uses 'something' that allows one to
write code for gas in devpac-like syntax. Does anybody know about
that or any similar tool and where to find them ?

- And slightly out of topic : is there any way to depack .rpm without
using rpm (in my MiNT/N.AES environment I have troubles to get rpm
to work) ?

Thanks for any suggestion
Gerhard

I think so, the object format is unchanged.

> - I heard rumours that FreeMiNT uses 'something' that allows one to

That's nothing special. The GNU assembler from binutils 2.9.1 understand
Motorola systax very well.

> - And slightly out of topic : is there any way to depack .rpm without

> to work) ?

The gcc, binutils and all tool + libs are available as tar.gz too. Or use
rpm2cpio to create a cpio archive. That you can unpack with cpio.

Tschuess

That would be `asmtrans' from the (Free)MiNT sources. It's a simple
lex/yacc-based preprocessor for assembler source files, which allows for
conditionals (like #ifdef in C) and is able to produce gas and pasm
syntax (at least, maybe some other formats as well).

Ciao

Thomas

Maybe nothing special but since I didn't know it (I only looked
at the syntax the compiler produces and didn't want to code in
that one) it's nevertheless great news for me :)

> The gcc, binutils and all tool + libs are available as tar.gz too. Or use

What I didn't find as tar.gz were fileutil and sh-utils. I did find
rpm2cpio in the rpm package, but, sorry to bother you again :(, where
do I find cpio ?

Thanks and Servus

The compiler generate MIT syntax that is in fact not very readable :-)

cpio is in the rpm bootstrapping archive too.

Hello! I am looking for help w/ my Atari 410 program recorder. It would not run & upon opening it up I discovered that the large drive band had snapped. I had a similar sized rubber band that I thought would do the trick, and it does allow me to FF and rewind, but it will not PLAY--The left wheel feeds, but the right wheel does not collect the tape. Any suggestions out there?? Is it possible the band is not tight/thick enough to work?? Or is there something I

am overlooking?? Thanks!

Dan

In casstte recorders usually the belt doesn't go round one pulley but
loops around 3 (or even 4). Not having one of these 410 recorder I
can't check where the band goes but I hope this helps.

Well I forgot to mention I also made a 'cp'/'copy'-like program that does work... Only the 'mkdir'-clone fails... Very strange.

BTW Frank, are background-DMA tranfers planned in the next FreeMiNT stable release ? (1.15.10 ? 1.16.0 ?)

And thanks for your reponsiveness !

There are a few caveats.

1. Don't do to many. On older machines the number of Mallocs that you can do at any one time is limited. But using 1 should not be a serious concern.

2. Mxalloc. I could be wrong but I think there is at least one card that added fast ram to a system that needed a driver in the auto folder. I can't remember what this was now. But in that case it should still just be a location of your program after the driver.

Well, it had to come to an end someday... I have to sell my old Atari stuff
to make room for other stuff.. :(Fortunately, my Atari will still live on
through emulation on my iMac, but emulation ain't perfect.

Anyway, below is a list of what I'm selling. Right now I am asking
$250+shipping for all of it. I will consider breaking it up if I can't find
a buyer for the entire package. I want to sell to someone who will take care
of this stuff and appreciate it the way I did. Reply to this in email if
you're interested!

That's the most likely explanation. You might be able to get an "O" ring of the same size as the original drive belt from maybe a hardware store or electronics supply house. Look for seals.

This seems to be configurable - my cross-gcc generates assembly listing
which look like this:

```
        .file   "test9.c"
gcc2_compiled.:
___gnu_compiled_c:
.text
        .even
.globl _test
_test:
        move.w _x,%d0
        cmp.w #33,%d0
        jbeq .L20
        jbgt .L26
```

I know of the following:

- MagnumST
- Magnum/F030
- Multiboard
- Marpet XtraRam

Basically, *every* card that has alternate RAM that does not start at
$01000000 (which is impossible in a 68000 machine or falcon with the
original CPU) needs a driver program.

Hi

What would be the best way to pass C arguments to an inline ASM piece of
code?

as in:
blaha(dummy)

and blaha is ASM code. Now i want to access the dummy variable, i know its
passed on the stack but how do i know where? As it seems its different

from time to time, caused by different OS calls?

Would this be he best way or can i put stuff into the data (d0-d7) or address registers (a0-a6) from C?

I use Lattice C from single tos.

regards
Fredrik

Yes but beware of scanning multiple folders, especially if your auto prog is going to stay resident - it'll eat heavily into the "40 folder bug" memory. If your prog returns before it triggers the bug then the memory will be handed back just fine (ie best to spawn a child to scan).

Hi Guys,

Can I use 2 standard 271001 (thats two 128kbyte) PROMs in STE hardware? If so is the full 256k addressable or is it limited to 192?

If this is not an option what are the alternative options?

Many thanks.

John.

If you know your compiler well enough you'd be able to figure out what
it does with certain arguments under which circumstances. Fortunately
it can be made a bit easier. Force the compiler to perform a standard
C call. That is, it should push arguments right-to-left and do so
using the stack - iirc Lattice uses __stdargs for this...

```
int __stdargs AsmFunc(int x, char *s, char c, int y);

//In C
int __stdargs
AsmFunc(int x, char *s, char c, int y)
```

```
{int z    =(x+y);

 printf("%d [%s] %c\n",z,s,c);
 return -99;
}

//In (rough) asm...

internal_label:
     ds.s "%d [%s] %c\n"
     dc.b 0

AsmFunc:
     link a6,$-4        //sizeof(z)

     move.l   8(a6),d0  //x
     add.l    18(a6),d0 //y (hopefully)
     move.l   d0,-4(a6) //z

     move.w   16(a6),-sp    //c
     move.l   12(a6),-sp    //s
     move.l   -4(a6),-sp)   //z
     jsr  printf_
     adda.l   10,sp

     move.l   -99,d0

     unlk a6
     rts
```

Note that I've guessed at the actual code generation but hopefully it demonstrates the principle. ;-)

27C010 work fine - if your type of 271001 is pincompatible, then it should
work (this depends on the manufactuter of the EPROMs - unfortunately, there
are two kinds of 271001).

And yes, you get the full 256K (starting at $E00000) - TOS 2.06 is too large
for 192K ROMs.

Is the lower start address ($FC0000 with current 192K ROM), due to the pin
layout of the new rom chips?

John.

And of course you can always have a look using a disassembler. :-)
TT-Digger can read DRI and Pure C object files. And binary programs.
Let the linker add symbol table info.

Hello Everyone,

I would like to know if anyone has archived the
old Antic, A.N.A.L.O.G. Computing, Compute
and/or Atari Explorer program listings?

I went to one web site that only seemed to have
just the texts from those publications copied.

I would like to have either downloadable files
and/or authentic copies of the listings.

Wally

No, due to the needed address space. $FC0000 - $FEFFFF provides only space
for 192K of ROM (and $FFxxxx can't be used, the IO space is in the upper 32k
there), so Atari had to put the 256K space somewhere else.

Greetings,

Does anyone knows how to play the game GARFIELD for ATARI ST ?

also if anyone still have the manual for it , I would really appreciate it.

Thank you in advance
Alvonzo

Hello Everybody,

I would like to know how to save a program
that I have written on my Atari800Win emulator?

I have an Atari 800XL computer which has a
crashed Atari 1050 disk drive, and I have chosen
to emulate all the software I have licenses to on
my PC.

I would really like to emulate my favorite programs

from both books and magazines.

Wally

Anyone considering the purchase of a Sony peripheral for their computer
might want to give it some further thought. There clearly is not a
reciprocal relationship between what they sell and what they service.
-
I purchased a CD-RW drive back in April that just recently went bad
(won't read). When I called Sony service, I was told that I could not
get a replacement and that I had to ship it across the country to be
"repaired" (and we all know what that means...) - with a three (3) week
turnaround. Assuming that they keep their 3-week commitment, with
shipping both ways, I'd be without the use of the unit for at least
five weeks!!!
-
I hardly think that's reasonable or fair.
-
Compare this to HP, who under the same circumstances would simply ship
you out a replacement unit and issue a call-tag for the old one.
-
Sony is a behemoth in the marketplace and as such, they have an
obligation to scale their service facilities to meet demand. To not do
so is an indication of their lack of commitment to customer satisfaction
and an unwillingness to stand behind their products.
-
Buyer be ware!

Back again from vacation and once again a dumb question.
I succeeded in converting the rpm archives to cpio but I haven't
been able to depack them with cpio and didn't find a man or info
page for cpio. So can anybody tell me the syntax to depack a cpio
archive or where to look for a description ?

thanks
Gerhard

Thought I would add....

Mighty Sonic 32 *
Afterburner * (if FAFAXX.PRG is used, Doug did change alternate RAM
detection/allocation within the A/B Tool Kit,RTM).

Both GE Soft utils added alternate ("TT") RAM to the system with Malloc
(initialized within the autofolder).

I think the Speed Resolution Card adds alternate RAM at a different
location than where "TT" RAM resides (for some strange reason) and did
have a specific driver, as Michael says below.

Mikey

Hi!

Frank Naumann <fnaumann@freemint.de> wrote:
> don't forget to use the correct syntax ('setenv' is a csh command).

And for those not knowing the right syntax for bash:

export PATH="enter-path-here"

Note that this will not work with a simple sh, so in /etc/profile,
better use the split-up form which is understood by all sh-style shells:

PATH="enter-path-here"; export PATH

Ciao

Thomas

Hi Everybody,

Does anyone know where I can get a copy of
"PAC-Invaders" for my Atari 8-Bit Computer?

Post your e-mail address so I can get that game
program as an attachment.

I have archived my Atari 800XL and now I use
the "Atari800Win" emulator on my PC.

Thank You Very Much,
Wally

Hi all,

For some odd reason, I decided to fire up my ST and finish writing a game I wrote starting in '96. Well, my old ST isn't what it used to be, so I need to finish the game on GEMulator. Problem is: My ST's floppy drive (actually the sound chip/floppy controller) is whacked and I can't copy STOS from the hard drive to my PC. I have the original disks, but two of them (games and accessories) will not read in my floppy drive.

Anyway, does anyone know where I can get a copy of these two disks on the internet?

Also, has anyone else tried STOS using GEMulator98? My mouse doesn't want to work, which makes it a real bear to load a file into it.

Thanks,

--
Greg

Hi!

You should be able to find it somewhere, I believe STOS is now freeware, at
least the sourcecode for STOS itself is..

/Peter

Of course if you wanted to you could just replace the drive in the ST.
Any drive will work. Just have to change the jumpers in the back.
Doesn't matter if it says "PC Drive" on the box. Or you could d/l a
program called PARCP. This allows transfer of files from ST-ST, ST-PC
or PC-PC by using the parallel ports. You just to have order or build
the special cable. I did that and it works great.

Nope, I tried replacing the drive a while back. That's why I'm convinced it's the floppy controller/sound chip. Sometimes it works, sometimes it doesn't.

That sounds like an idea. Either that or little null-modem action with ST Serial to PC Serial.

I'd still like to find replacement disks for STOS if anyone knows where they are.

Thanks,

Hello everyone,

Im trying to write GEM programs in Pure Pascal and having trouble even with the dialogue-
box example in the manual. Im a newbie to programming and doing it on a hobby basis, so
please try to speak veery sloowly and use easy-to-understand words.:-)

This program - its called HANDLE_F.PAS and the listing is in the manual to copy and learn
from; yes thats how far Ive got - I ahve lefte out big chunks of the listing and only left
those that I think are in connection with the problem

```
program xxx;
uses geminit,gem;
...
var
tree : AesTreePtr;
...
rsrc_gaddr(R_TREE,TREE1,tree);
```

and this is the point where the debugger (sometimes I feel like leaving out the "de") says:
ERROR: Types of actual and formal var parameters must be identical.

Since the "tree" Pointer is the only var-parameter of this function I think this must be
the problem. I have tried to move the .RSC file around on the HardDisc but that sems not to
be the problem.
geminit.PPU is one that i wrote off a listing in the manual as well. It works with the other
program (MYFIRSTGEM.PAS or something).

Ive been stuck here for a few weeks. If anybody has any hints as to where my stupidity lies,
I would be very thankful.

Gregory George wrote:

> Anyway, does anyone know where I can get a copy of these two disks on

> the internet?

Well, I managed to get STOS off of my ST. I was expecting more trouble out of the floppy than I actually got. I've also put it on my web space in case anyone else needs it. Compiler included.
http://home.att.net/~greggeorge/stos.zip

BTW, one of the extentions I've got in there (not sure which) would hose up GEMulator.

Has anyone seen a case where the ST works for the most part, but goes flaky just in some cases? In my STOS program, I am 100% sure certain screens were working perfectly when I originally wrote the program. And they work fine when I run the game on an emulator. But on the real ST, some screens are totally whacked. Any ideas why this would happen? Could it be a memory problem?

Thanks,

--
Greg

Hi Stephen

>Hhhhmmm! We still stock the HiSOFT s/w we published for the Atari

Nice to see a .sig with HiSoft in the content after so long. I think peop's could be
forgiven for forgetting you even existed, you dont go out of your way to publicise
yourselves in Atari world anymore.

Whilst your here, what if anything does HiSoft offer for the Atari now. I see that
Papyrus 8 is now available, and as this was one of your higher priority products i'm
suprised your not handling it now?. I'd have been one of the first to upgrade it via
yourselves as i did with every other pap version!.

You were one of the highest profile names in our scene with IMO /the/ best deveopment
packages available, all of which i bought from you, give us something to make us think
HiSoft next time we have some money to spare.

I was wondering what happened to
the FORTH programming language
for the Atari 8-Bit Computers?

It was supposed to be a free-wheeling
user friendly language, but I cannot
find myself a copy for either my
Atari 800XL computer or my
"Atari800Win" emulator.

I have Atari Basic and Mac65 for
the XL, also have Atari Basic and
Atari Asm/Ed for the emu.

Many thanks since at least I was one of those not knowing the
right syntax :-)

Now if I enter the 'export PATH' in bash then it works. Before that
the value of path is wrong. I even tried links from /etc/bashrc and

/etc/bash.rc to /etc/profile. But anyway since everything works
after entering a single command in bash I can live with that.

Another thing I was wondering about is whether it's normal that
bash (I use 2.0.2) is loosing characters at input. There is no other
application where I have these troubles so it can't be my keyboard.

Hi there !

I have a question about the possibility to use american cardriges on europeans Atari computers.
I own an Atari 800XL Secam (french system) since 1984.
I recently bought an Atari 800XL Pal.
I had a lot of cardriges and, without thinking twice, I used them on both system, and didn't notice any problem.
A couple of days ago, I found a shop in the USA, selling Atari cardridges at a low price. It sounds really interresting.

But a friend of mine told me that I would certainly be unable to use these cardridges on my european computers.
In fact, the cardridge would run but the image wouldn't display.
But I do wonder if the cardridges are linked/bound to a video system.
Aren't these cardriges supposed to work internationnaly ?
If not, how come that I can use my french cardridges on my pal computer ?

Furthermore, I've just bought a french (but Pal) Atari 7800.
And I have the same problem: can I buy american cardriges for that computer ?

I thank you a lot for having the patience to read me entirely.
I hope this trivial/simple/easy question won't bore you.
But I'm really longing to buy some new cardridges and an answer would be appreciated.

Thanks in advance.
Laurent (ficsx22@caramail.com)

Hello Henk

>Show us the formal definition of this 'rsrc_gaddr'

OK, hoping I have understood rightly Ill try.
rsrc_gaddr is the AES system call that gets the adress of the .RSC file.

Its syntax is

function rsrc_gaddr(re_gtype, re_gindex : Integer; var re_gaddr : Pointer) :
Integer;

with a number of possibilities for the type (R_TREE, R_OBJ or TEDINFO and BTBLK(or
whatever))and index (the name) of the object. The adress is a variable (in my
example,
tree) that this function writes the found address into.
The syntax is exactly the same in C, Basic and every other language since its an
AES-
system call. At least thats what I think, Ive read through a book on GEM
programming that
dealt with C and Assembler only and they used the same words.

O.K.
'var re_gaddr : Pointer' is the formal parameter declaration.
This is what you declared as actual parameter:

var
tree : AesTreePtr;

Now you must find out where 'Pointer' and 'AesTreePointer' are declared and see
what the differences are.

Note: In C rsrc_gaddr needs the address of the pointer, not the pointer itself.

I am NOT a Pascal expert, so I can not go into details, I just use general
knowledge.

Err.. that's not quite right.

It gets the address of an OBJECT/TEDINFO that has been loaded into
memory.

It does not get the address of the file.

Would anybody happen to have Atari's SLM 804/605 developper's
documentation?

On a related subject, has anybody successfully interfaced recent
printers to MiNT's lpd using /etc/printcap settings?

Basically, the idea is I wanna be able to use both of my printers
over my Intranet, from my Linux box to the TT's output.

Depends on what you want, try

http://www.fitz.cam.ac.uk/~acg29/atari.html

I know there is not much but I can provide loads of source code as I wrote over 200 menus and several demos in assembly.

If it's source listings to be used with Devpac then I have tons of it in my pd library.

If it's the source for Devpac's program itself, then that's a different story!

Hi

There may be a problem with these carts from the USA as they use a
different TV system to our PAL. Cartridges and systems that run in
Europe etc. shouldn't be too much of a problem .

Saying that, I have a couple of 2600 carts from the USA and I can use
them on my UK 2600 without a problem, but they may not work 100% on an
old tv.

When using mintnet ovl with ssl I sometimes get an alert
box saying that the post has been redirected and I'm giving three options
Get this Repost or Cancel

No matter which one I choose I will receive about 26 bytes and then it's
off to timeout 1,2,3.. and so on

I seem to have some luck when pressing the esc key but most of the time
most of the page is not loaded properly.

Should I just wait it out and hope for the best.

I have version 18404

Add a line with the word "noauth" to one of the option-files.

I wonder if you know how I can prevent that the log is written to the console. With the previous pppd every log was written to \var\log\ppp-log and \var\adm\messages but now with the latest pppd a part of the log appears on console too

I guess that's something you configure in syslog.conf. I've always
prefered direct output (I'm a control-freak, besides I don't like
log-files which tends to grow into the sky over time) so I haven't noticed
any difference. I suggest you examine the man-file.

Those aren't bad deals but since the Atari is pretty much a garage sale item these days, the software comes cheap to free. Hunting it down is the hard part. I'll keep your bargans in mind if there is something I can't find at a local flea market.

I've been working with Pure Pascal for as long as it exists and
I think it's the most user friendly and yet powerful programming
environment on the market. Since I never tried the examples and
rather implement 'sensitive areas' myself and not use RCS I thought
I'd let someone more experienced answer.
But since nobody did, I'll try to look at your problem but it may
take a few days 'til I find the time to do it.
BTW, just to be sure I look at the same thing, what version of Pure
Pascal are you using ?

Gerhard

Okay. So everything should be comparable.

And now the part where I will sound like a teacher but if you read it

to the end I hope you will have a bit less troubles in the future.

The error you encountered is not generated by the debugger but by the compiler. The reason why that is important is because at that time no executable code has been generated yet. Therefore e.g. moving the .RCS file could have no effect (since the program that reads it does not yet exist).

Short excursion, done veery sloowly ;-)
Step 1 : the compiler checks the syntax. In case of errors the processing is terminated, otherwise the source is compiled.
Step 2 : the linker puts it together with the other modules and creates an executable program.
Step 3 : you can start your program :)
Step 4 (if it didn't work) : you trace through your program step by step checking contents of variables and so on, hopefully finding out what's wrong (= debugging)

And now back to your problem. Since you typed in the program from the manual (instead of using the source file on the disk at path DEMO_HB/KAPITEL2/HNDLFORM.PAS which would have worked) you also typed the statement that is wrong in the manual :

```
var
tree : AesTreePtr;
```

which should be

```
tree : Pointer;
```

as it reads in the demo on the disk. If you change that single statement the program will work (if there are no other errors in the manual, I didn't check that).

Pascal does very restrictive type checks (and runtime checks, and ...) and that is one of the reasons I prefer it compared to C.

BTW, somewhere in the appendices of the manual there are hidden better descriptions of all the compiler and runtime errors.

Since you seemed a bit unhappy with your purchase let me tell you again that if something is bad then it's the manual and not the product. I think over the years I found three errors. Two of them were in 1.0 where they sent me corrections immediately after I contacted the hotline and the other one is still there in 1.1 but it's a runtime problem that occurs only in a very special and complicated situation and I've not been able to send them a demo program with less then 5000 LOC where it occured and they don't look at such big code parts. So I had to code a few lines a bit different and it worked. Anyway it's a very stable and reliable product and produces quite good and fast code and it's module concept and programming environment are better than at the other programming environments I know on the atari.

Hi Gerhard!

> (instead of using the source file on the disk
They seem to have cut down the number of files on their disks. I had to get some other
example program that was not listed in the manual by mail. And this one wasnt on the disk
either!

> the statement that is wrong in the manual
I had a suspicion that there was som error in the manual!!!

> in the appendices of the manual
I think you must have a completely different manual from mine. I got a 58 page A5-booklet,

the appendix is 2 pages and four lines.

>Since you seemed a bit unhappy with your purchase
Oh no! Not at all! The ":-(" was directed towards the fact that this version 1.1 will be the
last one for all times.

Hey, thanks a lot! Ill try it right away.

Bit later - Hey, it works - the program compiles without any error, but nothing happens. Is
it possible that the listing in the manual is not complete? Ill keep on trying

I guess Im probably too stupid for this stuff anyway

> I've not been able to send them a demo
>program with less then 5000 LOC
Good to get tips from the profs:-)

So if you can't find an old demo version that includes those files
maybe I should mail them to you as a zip file ?

> I think you must have a completely different manual from mine. I got a 58 page
A5-booklet,

>
> the appendix is 2 pages and four lines.

That's a shame. My manual certainly has more pages, is not A5 and IIRC
each of the several appendices is much longer than two pages.

> Bit later - Hey, it works - the program compiles without any error, but nothing
happens. Is
> it possible that the listing in the manual is not complete? Ill keep on trying

Shouldn't be compilabe if it were not complete. Maybe it would be
best if you tried 'run' or 'debug' instead of 'make'. 'run' would
execute the program immediately after compiling it while 'debug'
after compilation would wait at the first instruction so you could
step through the program line by line looking what it does.

> I guess Im probably too stupid for this stuff anyway

Most things look complicated until you got used to them. When I think
back to my first hour of assembler training, I suspected I'd never
be able to write a whole program in assembler :)

Yes. But you reach the "user screen" or something with the "esc" and can view the
result.

Hi Gerhard

>So if you can't find an old demo version that includes those files
>maybe I should mail them to you as a zip file ?
Sounds great:-)

In my manual, the "Crash-kurs" is built around the following programs.
HELLO.PAS (bit obvious)
B_P_TEST.PAS (dealing with breakpoints)
LOTTO.PAS - not on the disc but listing complete in manual
STACK.PAS - I didnt get that one on my disc
OOPDEMO2.PAS - I got it on request, but overlooked the previous one
After that, the GEM programs start
EYES.PAS
HANDLE_FORM.PAS - the one in question! It was not on my disc
MINESWEEPER
There are some programs on the disc (in DEMO/) called TETRAX, WURMIE, UHR. But when
I look at them I get the feeling Id better get started with something simpler

Ill try to find an old manual as well.

Greetings

Yes. But you reach the "user screen" or something with the "esc" and can view the
result.

Hi,

I recently installed GNU C 2.95.2 on my Falcon. The problem is,
this version doesn't seem to like the character \ e.g. at the end
of a line of a multi line macro definition. With older versions
(2.8.1) the code was compiled, 2.95.2 says something about a
'stray character \ in line xxx'.

Any ideas whether it's the compiler or my environment or something
else ?

thanks
Gerhard

Well.... It hasn't been developed for some yrs now....

AFAIK we still have some copies in stock. Contact sales@hisoft.co.uk
for more info.

Check if the file you're using ends its lines with CRLF or only LF. A
'\' must be the last character on the line, before the end-of-line
character, and if the file has CRLF at the end, and the compiler
expects it to be only LF, it might give an error.

Since I got the source code file from another guy who can compile
it I don't think that's the problem but I'll check it this evening
to be sure.
BTW he uses 2.91.66 and said he will try to install 2.95.2 too
to check if he gets the same problems then.

thanks

This sounds like the source files have atari-lineends (CR/LF), while gcc only works with Unix lineends (LF). Try loading the sources into GED or Everest and resave with Unix lineends...

Strip the ATARI cr from your src files. Otherwise the preprocessor don't work correctly.

Tschuess

Sorry to have bothered you all. I did change several files then and
this was the one I forgot to strip of the CRs :(

Although it would really be nice if it understood both line end
types.

Yes, from TOS 2.0x and upwards it's possible to remap these keys, but I
haven't seen it officially documented anywhere. I believe it was discussed
on the MiNT-list quite some time ago, so if you search the archive I think
you'll find it.

May I ask where I can find this archive? (I even didn't know such a thing existed...) Or best, if you know the way, why don't you just let us know. (It's late at night... or early in the morning... and I feel lazy.) ;-)

I don't mind if it's not "officially" documented; all I want to know is if it works on my Hades, in order to finish remapping all the keys to what's written on that PC keyboard. (I'm tired to remember how Atari keyboards are mapped.)

See you later,

Take a look at the thread "Loadable keyboards" in June 1998.

> No, the Alt combinations are handled by TOS and are hardcoded, AFAIK.
> You would have to write a completely new keyboard driver.

Only up to TOS 2.06.

"New code as of 5/92: in the all-countries cases (TT, SPARROW) we use
 the new variables salttran/saltshif/saltcl as associative lookup tables
 instead of doing the alt-key translation job in code."

Keytbl (XBIOS 16) returns the pointer to the KEYTAB struct. In newer TOS
versions, these consist of:
 - unshift table
 - shift table
 - CTRL table
 - unshifted ALT table
 - shifted ALT-Table
 - capslock ALT-table

The new tables consist of scancode, ASCII code pairs, terminated by a zero
scancode.

I am not sure if this was documented by Atari (I don't have a compendium
here), and if you should use this feature to load new keytables - but I do
not see much danger in using it as long as you are sure that the TOS
version
you are on does have these tables. It definitely is much easier than
writing
a whole new keyboard driver.

cu

Any one out there running RATSoft BBS and need a Y2K bug fix so that your
RATSoft BBS system can register new users?

The bug is, when a new user is entering his birthday, the BBS wont accept
any date format so the new user cant go forward in the registration process.

If you need this fix, droop me a email and i send it over!

Regards, Mabom

So do I, understanding this encrypted message. If your posting links to pirated material, I doubt you have much to worry about. See, there has been this revolution called Windows. Everyone is using it, I hear, so it pretty much makes the Atari market open to the few that have fond memories of the platform. Heck, if anyone is still looking to purchase Atari software, I think your honesty is admirable, but I'm sure they guy who has programmed it is now making his money elsewhere and could care less. If he does care, I can point him to a support group of Vic20, TI99a, and Adam programmers. ;-)

Hi,

I've been working some time on the asm part of the A800 emulator for the Falcon. The common part is in Gnu C.
Since I couldn't get 'make' to work with the 'Makefile', until now I always compiled the modules with single commands, but with every new A800 version this means a whole evening of typing a command every two minutes and I'm getting tired of that. So yesterday I tried 'make' again after installing GCC 2.95.2. BTW the environment is mint 1.15.5 and n.aes 2.0. 'make' said it doesn't know 'rm' and 'echo' and if I deleted these from the Makefile I'm sure other problems would be popping up.
So can anybody tell me what I did wrong or where I could find a FAQ or some description what I have to do to make 'make' work propperly ?

Gerhard

Hello Gerhard

> 'make' said it doesn't know 'rm' and 'echo'
I think you should either set the environment variable SHELL to the path and name of a shell that can interpret the rm and echo command or add a line to the Makefile that looks like the following one:
SHELL=C:\GEMINI2\MUPFEL\MUPFEL.TOS
where 'C:\GEMINI2\MUPFEL\MUPFEL.TOS' is the shell that I am using under MagiC. In your case you would probably use '/bin/sh' or something like that.
BTW: some versions of make try '/bin/sh' as default if SHELL is not set.

Hoffentlich hilft dir das was.

Greetings,

Daniel

> 'echo'

GNU Makefiles often use tools that are part of the Unix system. As you doesn't have installed these tools the Makefiles don't work.

Just install the bash, fileutils, shellutils and try again.

Tschuess

    Assembler-related:
http://www.dhs.nu/ (Coding utils section, almost all is here)
    *nix-like tools (w/ C, C++, Java, FORTRAN, ...):
http://www.freemint.de/
(for all these you should install MiNT, a *nix/Linux-like system extension)
    Many programming stuff is also available at:
http://ftp.lip6.fr/pub/atari/Programming/ (also reachable thru anonymous
FTP)
Among these SozobonX which is a nice lightweighted C compiler.

    You can also check:
http://uptodate.atari.org/ (Programming section)

BTW have you played Starsky on TV some day? ;P

Hi Michael,

> what sort of development packages
-GFA Basic 3.6 TT (out on a CDROM from Falke Verlag with a lot of extras, ca 30 EUR)
-Pure Pascal 1.1 (from '95 I guess, compatible to TP 7, available at AHS)
-GNU C++ 2.8.1
-weird (to me) things like mupfel and MiNT-related stuff that I don't understand (either).

Thanks.

I use to before I change my name from Paul Michael Glaser to just Michael
Glaser. Ah, those were the days. David (Soul) and I still keep in touch
but I haven't seen Antonio Vargas(Huggy Bear) in about 10 years. The last
thing I heard he did was "I'm Gunna Get You Sucka". He played the most
believable pimp. A true pimp artist.
I quit acting soon after my wife and child died from AIDS. Now I just keep
busy doing charity events and working on my Atari Falcon.

I was looking more for Assembler or C(or better yet, C++) stuff. I've come
across a couple of things, but the GNI C++ really made my ears perk up. For
one thing, I didn't know C++ was available for the Atari.
A friend of mine use to love GFA basic. Is it much like Visual Basic? How
fast is it?

Since my days with the Atari ended when the Falcon came out, I'm still
pretty "stupid" as to the "real meat" of MiNT, but after revisiting GEM, I
see a real need for some improvments. I'm sure that has allot to do with
the fact that I've been snuggling with Windows with so many years, but the
left mouse button is greatly unused.
I've been going over my book, so I'm sure I'l be a little more knowledgable
in a bit.
Now I just need a project to work on.

> GFA basic. Is it much like Visual Basic?
NO!!
The newest version of GFA is from 89. It uses some routines that don't work
anymore and
you have to rewrite them (Fileselect). Its user interface is, erm, quite unique.
It uses
no GEM, otherwise-unheard-of hotkey-combinations, has a weird old-fashioned

screen. It
doesn't work with MagiC, screenblasters, graphiccards.
BUT it has a heuuge (in Atari terms) following of fans who have grown up with it. A load of
people have written patches (to make it work under MagiCMac e.g) and it's very easy to
find help on the net.

>How do you get this gfa cdrom anyway?
Try info@mucs.com, they have it in their ads. If you read german, you can buy a package
consisting of the CD and two books, one of them quite easy to work with if you mean to
program under GEM. The other one is by Ostrowski himself, but it was too high for me.

I don't read german very well at all. ;-)
Thanks for the info anyway.

It's not really like Visual Basic. You can try faceValue, which
claims to make gfabasic feel like visual basic, but it's really
just a collection of canned code for windows and menus and such.

Speedwise it's ok for most tasks, depends on what you want to do
I guess. It does have limits.

For more info on gfabasic have a look at my web page as I'm
still a fan of gfabasic.

In combination with the add on Face Value YES!

You simply let your code react on events from the Face Value engine and all "low level" GEM handling of the user interface is taken care of automatically.

I would be interested in hearing from people with non-British keyboards what value their _AKP cookie reports. Even more useful would be reports from people whose keyboard and TOS are of different nationalities. Please give the machine and TOS version in each case.

The cookie value may be established from the COKKIES.CPX by Dieter Fiebelkorn, or one of the system testers mentioned below.

The reason for the enquiry is the discrepancies between Mark Baines's PROFILE2.PRG as compared to other similar testers on the keyboard nationality of my British Falcon. This reports:

```
     Keyboard nationality and language:   United Kingdom and English
```

and in the cookies list:

```
     _AKP    $00000003             3
```

All the other testers give the same cookie value, but interpret the keyboard and/or TOS nationality as USA.

Thus in Christophe Boyanique's Sha'uri, in Cookies listing:

```
                                 -------
     _AKP $5F414B50 ($00000003)
    Keyboard language: USA
```

```
    TOS language:      UK

But it also reports in Non-Volatile RAM listing:
     TOS language:          USA
     Keyboard language:     UK

Sysinfo2 by David Troy from Toad computers reports:
--------
     TOS Country:        USA

and in the Cookies list again:
     0x5f414b50 (_AKP)    0x00000003

SysInfo V4.80b by Thorsten Bergner reports in System:
-------
     Country      : GBR

and in Non-Volatile Memory
     Keyboard     : GBR
     Language     : GBR

but in Cookie list:
     _AKP        3  Keyb. : USA / Country : GBR

Now the 'Atari Compendium' states for the _AKP cookie:
'...The high word of this cookie is currently reserved. The low word
indicates the language currently used by TOS for keyboard interpretation
and alerts. See the explanation for the country code in the OS header
earlier in this chapter for valid values.'

That section lists the os_conf and countries (0 = USA ... 3 =UK ...) and
adds 'As of TOS 4.0 the OS is compiled with text for all languages and
switches between them based on the country code stored in non-volatile
RAM. Use the _AKP cookie to determine the actual language in use.'

There seems to be nothing explicit there about using different parts of
the value for keyboard and TOS nationality.

On the other hand Zorro's TOS.HYP states, in translation:

 _AKP       Keyboard layout and national language
            The Cookie gives info about the language and the keyboard
            layout of the system. Bits 0-7 inform about the language:

             0 = USA
              ...
             3 = England
               ...

            Bits 8-15 identify the layout of the keyboard

              followed by the same table.
```

Sha'uri too uses a similar explanation of the cookie:

```
_AKP        Advanced Keyboard Processor
            high word reserved
            very low word: keyboard
            low word:      TOS language
```

and may have got it from the same source.

It is possible, I guess, that the above applies to pre-TOS 4.xx machines. I am told by a German user that his machine returns $00000101 but I am not sure which TOS he is running.

Thanks for your help!

Regards, /Peter/

Frank Naumann wrote:
> Just install the bash, fileutils, shellutils and try again.

I first tried rpm (although I don't find the concept very convinient, I don't see any advantage compared to tgz files) but rpm complained about not finding rpmsh (or something like that), probably caused by some missing symbolic links (I did see the file it complained about). So I couldn't depack any of those rpm packages.
Next try was to free an additional partition and let KGMD install

itself there. Then I copied everything useful from there to my
/usr/bin. Now, as long as I'm in /usr/bin bash understands all the
commands, but that ends after the first cd command. Probably another
case of missing symbolic links ? Or something missing in mint.cnf ?

Hmmm, well then, I think I'll stick with Assemble and C. It's been a few
years since I've messed with both of those languages, but I know I can
remember 68000 assembler after a few moments and C, well, a couple of
refresher courses and I'll be back to normal.
I've got The Atari Compendium as well as several other book(Yes, even the
cryptic Abacus collections). They should get me going.

Thanks,

Do you have linked /usr/bin to /bin? You can do this with these statements
in your MiNT.CNF:

```
sln #:\bin  u:\usr\bin
sln #:\etc  u:\etc
sln #:\home u:\home
```

```
sln #:\tmp  u:\tmp
sln #:\usr  u:\usr
sln #:\var  u:\var
```

With # as your drive letter. And don't forget to setup a correct environment ($PATH, $HOME, and so on). For this best look into the KGMD documentation and the configuration sample files.

Tschuess
...Frank

My Falcon (french machine/keyboard) reports _AKP $00000202 but I thinks it directly related to the NVRAM setting. My TT (tos 3.06) do not have the _AKP cookie.

I used this information to hack an _AKP cookie for Magic to try to make HD-Driver, Bootconf, etc., "speak" English in Magic 6.10 (german version): no luck.

My reference is the Compendium (paper edition).

Bye,
/Pascal/

Hi

There are some commercial packages knocking around. The best are Devpac for Assembler, although I think most people use v2 the latest is v3, and Lattice C v5.6 both from HiSoft.

I do have a copy of Devpac 3 spare and Lattice C 5.6, coincidentally:)))))

Haha, coincidentally I just got a hold of those same programs. Originally, I knew they were one of the last development packages to be released for the Atari, but I was having a hard time finding them. I have an older version of both that I purchased years ago, but I wanted a more up-to-date release so I can support the whole Atari line.
I'd be nice if I could do the development on my PC, but it seems PacifiST and they other emulators out there only support TOS version around 2.06(I noticed a French version that was 3.01).
Either way, I will create at least one useful tool on my Falcon.

If you have any other tools you think might be useful, please fill me in. Like I said, it's been so long since I've been on my Atari, that I'm really out of touch.

Thanks,

Hi

PacifiST SHOULD support whatever TOS image you are using... When I
tested it out, many moons ago, I ran it with 1.6, 1.62 and 2.05!!! You
just need the TOS images.

There is other utilities you can aid programming, but most of the ones
(if not all of the hardware ones) run on pre TOS 2.06...

When using Newsie v96 under mintnet,newsie will exit and I get the message
pid 129 (newsie) bus error user pc=ffff001c address:69b190 (basepage=66ac60)

I have received the same with latest beta kernal of mint.I am now using mint
1.15.1 (falcon 030).

I connect with pppd 2.20.

If you know assembler and "C" already I would say stick to those.
Although I'm hooked on gfa myself, gfa does not give you much
control over a project. Happying coding... ;-)

If you are using mintnet, give aMail a try and or/pine. Newsie does
alot but pine is much nicer for news.

Hi Mike

I'm no mintnet expert, but if you don't have Gluestik you should
get that if you want to use programs that are programmed for the
Sting/Stik API.

Cheers J⍰rgen

Hi Michael!

I get that too under Sting/MagiC 6! Also my Falcon doesn't like the
sub-menus, where the machine just freezes if I try them.

Also I get a crash when I try to download mail!!! :(

I reported these problems to John Rojewski, whilst v0.96 was in beta, but
they don't seem to have been fixed for the full release.

It's too bad. I've had to go back to using v0.94. :(

Cheers!

James

I was trying to be nice to newsie, but obviously you've never
tried it? Relatively speaking PINE handles news way better
than newsie. If PINE is horrible then newsie is what?? ;-)))

I think I located my main problem, untortunately without knowing
a solution. I have included above mentioned links in mint.cnf
(and mintnaes.cnf since that seems to be copied to mint.cnf when
using n.aes) and I changed $PATH to include /usr/bin but when after
rebooting I activate bash and say 'echo $PATH' /usr/bin is not in
the list. There is no 'setenv' for PATH in bashrc (or bash.rc).
So I don't know where the wrong PATH can come from. Any idea ?

BTW, thanks for the other tips until now. At least I feel I'm near
to the goal now.

Gerhard

I got all the needed utilities by installing KGMD on a spare partition and then copying everything missing from there.
The 'professional' way would have been to get the rpm packages from the sparemint page and install them using rpm but when I tried that I got an error that rpm doesn't find rpmrc (although it was there) while the KGMD installation worked without problems. So, looking back, I think the best way is starting with installing KGMD (or KEMD since it's a bit newer).
Then you have an old but complete system.
Afterwards you can put GCC 2.8.1 or 2.95.2 (and whatever else you need and can get) on top of it.

No, the naes.cnf is a completly different hing. Best delete $PATH from
naes.cnf and set it only in MiNT.cnf.

> and I changed $PATH to include /usr/bin but when after

For bash you can use the global configuration file /etc/profile. And
don't forget to use the correct syntax ('setenv' is a csh command).

Tschuess

Hi!

In article <Pine.MNT.4.10.10003122330410.183-100000@tt030>,
     Lonny Pursell <atari@.SYNTAX-ERROR.> writes:

> Testing PINE setup.

Mhmm, is there any reason why you (and others) don't use the
test-newsgroups to test setups? That's why they exist ...

Ciao

Thomas

>
>Undefined symbol GEMformwindow::GEMform virtual table referenced from
>text

Dunno - comes across as cryptic in this context. Methinks you'd have
to have seen this error in a less complex situation to figure out what

it really means. It *appears* to be saying that class "GEMformwindow" has a method named "GEMform", for which a definition could not be found.

If I were to hazard a guess at the cause - look for what appears to be its definition, then "grep" elsewhere for all the code that calls it. It's possible that in this compilation attempt GCC has overloaded a GEMform() which "it should not have" (ie check datatypes being passed).

>Undefined symbol _InFocus__13GEMformwindowb referenced from text

Dunno - looks mangled but it doesn't match the below!

>Undefined symbol GEMformwindow::~GEMformwindow() referenced from text

Odd. Where's the GEMformwindow destructor? Is there one, or has it been implicitly supplied by the compiler. If the latter then check compilation options - the feature may not be enabled. (ie empty ctor/dtor will be generated for you by default - this may not be happening).

>Undefined symbol ___ti13GEMformwindow referenced from text
>Undefined symbol ___tf7GEMmenu referenced from text
>Undefined symbol ___ti7GEMmenu referenced from text

The above look like mangled names. Again, this could be down to "accidental overloading".

>gemw.o: Undefined symbol __intin referenced from text
>gemw.o: Undefined symbol __intin referenced from text
>gemw.o: Undefined symbol __intin referenced from text
>gemw.o: Undefined symbol ___aes__ referenced from text
>gemw.o: Undefined symbol __intout referenced from text
>gemw.o: Undefined symbol __intout referenced from text

The ones above look suspiciously like you have omitted to link in the module that defines the "parameter passing arrays" for talking to Gem. It might be a compiler option or it might be a module. However, it is possible that you're required to define them yourself.

>Does anybody know what I might be doing wrong (again) :)

'Fraid I've never used GCC - a user of GCC would, of course, know better!

I honestly had no idea there was such a newsgroup.
Anyone have the full group names for these?

alt.test comes to mind. Best of all, numerous autoresponders monitor that group and send email confirmations - that way, you can be sure that your message is propagating and not being held up at your ISP.

I'd carry on using the main echo's, a test message being posted usually
starts up quite a healthy thread on the relevant software, and is usually
the only worthwhile traffic.. 8~)

Hi!

In article <Pine.MNT.4.10.10003141626550.104-100000@tt030>,
    Lonny Pursell <atari@SYNTAX.ERROR> writes:
> Anyone have the full group names for these?

Almost all internet provider with its own newsserver provides a local
test group, maybe something like bright.test for you, I don't know.

Also, there's a test group for almost all toplevel news hierachies, e.g.
alt.test, de.test, fr.test, uk.test, ... Many of those are watched by
"reflectors", i.e. you'll get an email response when they "see" a
message from you.

Ciao

Thomas

Hello,

I search of documentation on the structures of file RSC. I created a
program to extract the icones from 2 to 256 colors of the files Windows
ICO and CUR (files DLL, EXE and OCX in progress). I would like to record
them in a file RSC with format CICON. The documentation which I have
(Compendium, Atari developor divides into volumes 1 and 2) are a little
light on this subject. I saw well the structure RSHDR in PURE C, but no
documentation on the pointers of objects. I believed to understand that
there was a file RSCREATE.C which would seem well to answer my request.
Can you help me to find it. Thank you by advance.

Well I tried to get alt.test and did, but geesh it was huge,
something like 11,000+ msg's and so I gave up. My solution
will be if I need a test, I'll reply to a post as usual and
hope like heck it works. ;-)

Unfortunately Mark Wherry seems to have gone into deep hibernation - that
web site has been down for a long time now.

May I suggest GEMScript as an alternative? The author states that it will
interpret Scripter scripts, I don't think that Mark's will. I don't have a
URL to hand I'm afraid...

Thanks a lot Guy for your suggestions! Too bad you were the only one
who noticed my post...
I think the problem is that the gem++ library was built using some
earlier version of GCC, most likely 2.5.8 and there are some things the
2.8.1 version is simply more sensitive about.
Is there anyone out there who has maybe rebuilt the library with some
of the newer versions of GCC, I think that would be worth it? I tried
it myself, but I just don't have neither enough patience/time nor
experience.
Warwick Allison left the Atari platform and is now working on Qt, so he
can't support the lib any more. Has anybody continued his work?
Thanks,
Nenad

Hi,

I'm a newbie to HiSoft Basic. I have succesfully compiled a few demo.bas files, but others like SHELL.BAS simply won't compile. Error #65.
Other demo's needed large buffers etc. and the right path settings but with this one nothing I've tried works. Anybody who can help a bit?
Thanks in advance!

Guido

Anyone ever write a GFA program for accessing an OVL module?

I have the understanding of how to do it in C. But am looking for some way that wouldn't be a bear in GFA.

I'm not wrting the GFA section and it's been years since I've really worked with GFA so I've come to you fine folks for help.

The question is how to pass back a pointer to an API structure to the Parent application (GFA program), without making the parent application search through memory for a magic string. Is it possible? It seems like there should be some nice trick for doing this, but so far it's escaping me.

Any ideas or input would be greatly appreciated!

Is it possible to load an OVL and then execute it, apon which
the return value is a pointer to a list of pointers within the OVL?

I really don't know how OVL's are dealt with, but this idea
struck me when I read your post. I'd be interested to know
how they are handdle in "C" if you can explain that in terms
us GFA users can grasp. ;-)

I was about ready to go through your example in detail to lp.

I'll have to go back over the code, I thought this is what you
were doing with the code you sent me some years ago. I'm just too tired
right now to parse any of it.

So when are you going to come back home and program some Atari
stuff :)

Come on you know you want to do it!

Lp you have your PUG interface code still around?

As to the messaging you asked about. I had thought about that. It would be simple to send a message back to the parent advertising a memory address for the init. However to do this would either involve breaking the address up or sending it as a long. I'm certain there are a few people around here that would argue against sending anything other than the 8 int array that AES messages are currently made up of.

That bit of code I got you to write for PUG did exactly what you've
surmised here. I keep meaning to bung what I've got left on my website
when time permits. In the meantime, I've tagged the relevent sections
into my reply to Dan.

A Pexec(3),Pexec(4) combo was what I ended up with - 'twas the only
thing that worked 100% reliably even with the oldest Gem.

> I'm not wrting the GFA section and it's been years since I've

Contents of pugbind.c - Lonny recoded this in GFA yonks back and it
worked. It was to be the only language dependant part of using PUG...

```
/*
This source should be included in your makefile dependant on PUG.H

It is responsible for locating and loading the module PUG_MOD. It
first looks
in the current directory. This may fail under multitasking so it then
looks
at the executable path and replaces the executable name with PUG_MOD.

Having loaded the module, it executes it so that PUG_MOD can hand back
memory
via PtermRes().

It then proceeds to locate the header and writes the PUGFUNC structure
pointer
to the caller's space for subsequent access to the overlay's
functions.

It returns zero for failure or non zero for success, in which case the
value is
the version number. The high word contains the major version number
and the
low word contains the minor version number.
*/

#include <basepage.h>
#include <osbind.h>
#define  DEF_LIB_ONLY
#include <libc.h>
#include "pug.h"

sint memcmp();
char *strrchr();
char *strchr();
```

```
ulong
Pug(pug_mod,pfpp)
char pug_mod[];
PUGFUNC  **pfpp;
{slong        r;
 BASEPAGE *bp;
 slong        i;
 char         *p,
         s[256];
 sint         h;

 /* ?module exists in PUG environment? */
 if (p = getenv("PUG")) {
     strcpy(s,p);
     strnextdir(s,pug_mod,false);
     }
 else
 /* ?module exists in current directory? */
 if ((h = Fopen(pug_mod,0)) < 0) {/* no */
     /* get executable directory */
     shel_read(&s[0],&s[128]);
     /* remove executable name */
     if   (
          ((p = strrchr(s,'\\')) == NULL) &&
          ((p = strchr(s,':')) == NULL)
          )

          p = &s[-1]
     ;
     /* add module name */
     strcpy(&p[1],pug_mod);
     }
 else    {
     Fclose(h);
     strcpy(s,pug_mod);
 }

 /* ?module overlay loaded? */
 if ((r = Pexec(3,s,NULL,NULL)) < 0)  {/* no */
     sprintf(s,"[3][Pexec(3) failed|Code %d|File %s][Typical]",
          (int)r,pug_mod
          )
     ;
     form_alert(1,s);
     return 0;
 }

 /* execute module startup (Ptermres to hand back unused TPA) */
 bp = (BASEPAGE*)r;
 Pexec(4,NULL,bp,NULL);

 /* search module data segment for header */
 /* kludge for development version */
```

```
 /* saves manually ensuring header is linked at start of data segment
*/
 p = (char*)bp->p_dbase;
 for (i = 0; i < bp->p_dlen; i++)    {
     if (memcmp(p + i,PUG_HDR_TXT,PUG_HDR_LEN) == 0)    {/* header
found */
          /* set function pointer structure */
          *pfpp = p + i + PUG_HDR_LEN + PUG_VER_LEN;
          /* version number */
          return *((ulong*)(p + i + PUG_HDR_LEN));
     }
 }

 sprintf(s,"[3][PUG Overlay %s|Cannot locate
header][Typical]",pug_mod);
 form_alert(1,s);
 return 0;
}
```

So basically, the caller is supposed to have passed the address of a PUGFUNC structure pointer to the above function. Extract of pug.h, in good old MWC K&R of course...

```
/* access to functions */
typedef struct     {
void (*pg_enable)();         /* "ignition on" */
void (*pg_disable)();   /* "ignition off" */
PUG* (*pg_mem)();       /* dynamic memory managment */

bool (*pg_old_dial)();  /* close window */
uint (*pg_dialogue)();  /* evnt_multi() replacement */
uint (*pg_obstate)();   /* change object ob_state
intelligently */
uint (*pg_obflags)();   /* change object ob_flags
intelligently */
void (*pg_force)();          /* (ud) force redraw if at all
possible */
uint (*pg_evm)();       /* (ud) direct EVM access */
char*    (*pg_obstr)();          /* write string to object
intelligently */
void (*pg_centre)();         /* centre window (obsolete) */
void (*pg_underline)(); /* keyboard shortcut conversion */
void (*pg_hide)();      /* move window offscreen */
void (*pg_show)();      /* bring window back onscreen */
char*    (*pg_exepath)();   /* return executable path */
void (*pg_pos)();       /* set window position */
bool (*pg_nxt_dial)();  /* close this window, open next */
sint (*pg_is_mine)();   /* (ud) return PUG handle for AES
window */
bool (*pg_init)();      /* (ud) complex window initiator */
bool (*pg_term)();      /* (ud) complex window terminator */
```

```
ulong    (*pg_dyn)();       /* (d) very high level memory
management */
sint (*pg_list)();      /* scrollable objects */
bool (*pg_name)();      /* set WF_NAME */
bool (*pg_info)();      /* set WF_INFO */
void (*pg_fitdesk)();   /* (ud) force large window to be sized
down */
/*
 * ud as yet & possibly transient ...
 * included to get a feel for if these should be included in their own
 * right or buried within other functions
*/
void (*pg_logging)();   /* (stub) could be used for trace
level */
void (*pg_log)();       /* user logging function */
void (*pg_edoff)();         /* force (already enabled) cursor off
*/
void (*pg_edon)();      /* try to turn on (disabled) cursor */
void (*pg_msg)();       /* send a AES message */
/*
 * new ...
*/
sint (*pg_alert)();         /* alert in a window */
sint (*pg_printf)();
uint (*pg_gs_wk)();
sint (*pg_gs_wh)();
OBJECT*  (*pg_gs_ob)();
int  (*pg_gs_obi)();
bool (*pg_gs_act)();
int  (*(*pg_gs_uiv)())();
OBJECT*  (*pg_gs_icob)();
char*    (*pg_stem)();
bool (*pg_bubblegem)();
char*    (*pg_rsc)();
}    PUGFUNC;
```

And finally, the imaginately named pug01.c to round off...

```
#include "pugg.h"

extern int    global[];

void
pug_enable()
/*[  void pug_enable()

Once the PUG overlay module PUG_MOD has been loaded by PUG then
pug_enable()
must be issued so that the overlay and the user process can
communicate as one
with GEM.
]*/
{
```

```
 appl_init();

 /* resource file header pointer */
 global[5] = global[6] = 0;
}

void
pug_disable()
/*[  void pug_disable()

Separates the user process from the overlay prior to program
termination.
It does not unload the overlay.
]*/
{
 /* some desktops will update their windows */
 sm_drives(NIL);

 appl_exit();
}
```

Oh, nearly forgot. In a *very* loose manner, an app would do this to get things started...

```
PUGFUNC  *gl_pfp;

main()
{
 Pug(PUG_MOD,&gl_pfp);
 pug_enable();

 //app here

 pug_disable();
 appl_exit();
 exit(blah);
}
```

...where the actual PUGFUNC struct is a simple asm source, mirroring the C declaration, which is pulled into the overlay by the linker...

Okay, somewhat involved for the overlay author (it isn't really - just "dumb coding") but more importantly there is very little required of an overlay *user*, as is apparent from the slimness of main() - unlike myself, who seems to grow less slim each waking day. I digress. Time for bed. <G>

Hi!

Can anyone show me how to reset the Atari system? I need it for a shutdown manager. I'd prefer a clean method, elsewhere a dirty hack might do as well.

Thanks, Michael.

If that is what you are talking about:
```
     jmp ([$4.w])
```
(trash some memvalid-like system variables to perform a cold one)
oups sorry, 68000 version here:
```
     move.l $4.w,a0
     jmp (a0)
```

IIRC you can use _sysbase systeme variable to do this also:
```
     move.l _sysbase.w,a0
     jmp (a0)
```

You should shut down all the applications first.

To do a soft reset, look at the address in memory address 4. Get this address and jump to it.

Here are two ways in assembly (in super mode)

```
move.l  4,-(sp)
rts
```

OR

```
move.l  4,a0
jmp (a0)
```

Hi Guillaume!

GD>IIRC you can use _sysbase systeme variable to do this also:
GD>   move.l _sysbase.w,a0
GD>   jmp (a0)
Which is the more clean way since it points to the OS header of the currently running OS. $4.w does always point to the ROM's one

Bye

Joerg

Under MiNT always use Shutdown(long restart) system call (0x151).

I've put together a small archive at my site that shows at least one method of implementing and using an OVL file. Both the OVl and client are very simple, so it should be a good starting point for someone looking at doing this sort of thing. The OVl only has 3 stub routines, just enough to operate and show that it's working. Enough I think to illustrate the method.

While in a way we are moving away from the idea of OVl files, I think they still have situations where they are useful. So if you are interested in how to use/create an OVL file grab the file.

http://www.netset.com/~baldrick/products.html

Maybe someday I'll round up some GFA examples for this as well.

Hi!

In article <38E1FD44.167C4619@tu-bs.de>,
    Michael Nau <m.nau@tu-bs.de> writes:
> I'd prefer a clean method, elsewhere a dirty hack might do as well.

OK, you've asked for it, you get it ;)

```
static long get_reset(void);

void reboot(void)
{
    long    r,
        reset_address;

    /* First, try using MiNT's Shutdown() call */
    r = Shutdown(1); /* GEMDOS 0x151 */

    /* If it returns, then either the current GEMDOS doesn't support
     * Shutdown(), or Shutdown() failed for some reason
     */
    if (r != -32L)
    {
     /* System supports Shutdown(), but it failed */
     return;
    }

    /* OK, system does not support Shutdown(), so let's use the old way */
    reset_address = Supexec(get_reset);
    Supexec((void *)reset_address);

    /* Mhmm, Supexec() returned, something must have went wrong ... */
}

static long do_reset(void)
{
    /* Get contents of address 4, which contains a copy of bytes 4 to 8
     * of the TOS header, which in turn resemble the start of the reset
     * routine (the MC68xxx family uses the contents of address 0 for
     * SSP, and the contents of address 4 for PC on power-up or
     * hardware-reset)
     */
    return (*(long *)0x4);
```

}

If the function reboot() returns to the caller, something very strange
has happened ...

Of course, in assembler this can be done a lot shorter, but this way it
should be more comprehensible.

Ciao

Thomas

GFA-Basic OVL example:
Well I totally forgot about the PUG OVL until you mentioned it.
I will zip it all up soon and post it on my GFA-Basic pages.
Still amazed I found the old project. ;-)

About the reset:

with a jump to the start of TOS you get a reset.
But remember: it will never be as if the power was downed.
Take for instance a reset-resistent RAM-DISK

> Take for instance a reset-resistent RAM-DISK

Such a RAM-disk won't survive a reset with both resvector and one of the
memvalid variables cleared. Of course, you can still play tricks using
the PMMU to completely avoid resets, but a software-triggered cold-boot
will kill reset resident stuff.

Ciao

Thomas

I don't think any cassette prgs were ever made for the ST. Check your
crossposts please!

You want to make copies of data file cassettes? Play on one and record on the other. (which is how I used to make copies of Zaxxon 15 years ago, their ridiculous copy protection only made loading the game harder to do). The cassettes are audio. You might want to clean the heads on the cassette players, it don't take much to screw up the recordings.

LEGAL CABLE TV DE-SCRAMBLER

Want to watch Sporting Events?--Movies?--Pay-Per-View??

*This is the Famous R-O Shack TV Descrambler
You can assemble it from Radio Shack parts for about $12 to $15.

We Send You:
1, E-Z To follow Assembly Instructions.
2. E-Z To read Original Drawings.
3. Total Parts List.

**** PLUS SOMETHING NEW YOU MUST HAVE! ****
Something you can't do without.

THE UP-TO-DATE 6 PAGE REPORT:
USING A DESCRAMBLER LEGALLY

Warning: You should not build a TV Descrambler without

reading this report first.

Frequently Asked Questions--CABLE TV DESCRAMBLER

Q: Will the descrambler work on Fiber, TCI, Jarrod
and satellite systems?
A: The answer is YES. In respect to satellite,
you just get more stuff! There is one exception:
The descrambler will not work with DSS satellite.

Q: Do I need a converter box?
A: This plan works with or without a converter box.
Specific instructions are included in the plans for each!
Q: Can the cable company detect that I have the descrambler?

A: No, the signal descrambles right at the box and does
not move back through the line!

Q: Do I have to alter my existing cable system,
television or VCR?
A: The answer is no!

Q: Does this work with my remote control?
A: The answer is yes. The descrambler is
manually controlled--but very easy to use!

Q: Can you email me the plans?
A: No the program comes with an easy to follow picture guide.

Q: Does this work everywhere across the country?
A: Yes, everywhere in the USA plus England,
Brazil, Canada and other countries!

Q: Is this deal guaranteed?
A: Yes, if you are unhappy for any reason we will refund your money.

Q: When I order, when will I get my package?
A: We mail out all orders within 24 hours of receiving them.

Q: How much does it cost to get the instruction
plans, the easy to follow diagram, and most
important of all the "Using a Descrambler LEGALLY Report".
A: You get the complete 6 page report and instruction package all for just--$10.00

Q: How do I order?
A: Fill out form below and send it, along
with your $10.00 payment to:

CABLE FREE-TV
12187 S. Orange Blossom Trail #116
Orlando Fl 32837

(Cash, Check or Money Order.)

(Florida residents include 7% Florida State Sales Tax)

(All orders outside the U.S.A. add $5.00)

Hello,
ask Bo and Ernest Schreurs about their Cas to WAV converter program...
quite interesting background story !! Besides, copying from (Hifi-)Tape
to Tape is easier and to a digital destination (like DAT, DCC, MD, CDR,
CDRW) is far secure (but wastes to much memory). greets- Andreas
magenheimer

P.S. Why not keep the cassettes as original source and use a disk-file
as backup... (if you own the original program, you are allowed to have
backups on any medium)

Hi Gadget! :)

Unlike the other repliers who seem to think this is a bit of a joke, you certainly have an application if you are using a Spectrum emulator etc.

To capture a program from tape, you could use a sound sampler and hook up your tape player either into a sound sampling cartridge on an ST or into the microphone socket on a Falcon.

There is a way to then play them into the emulator, but I've never really looked into this.

Cheers!

James

Bonjour a tous :)

I have nearly finished GEMScript implementation for Joe.
But there's still a question/difficulty (cannot understand well
the German doku, my apologizes):

How do you send in the ACK the TRUE or FALSE values. In litteral
(english or German ?), or in number with 0 and 1?

Thanks for anwsering.

Bye

Hi All,

I know I have asked this before, but.....

I would still really like to be able to write GEM
programs on my Atari using GNU C++. The problem I
am having is figuring out what the latest version
of the Atari port of GNU C++ is and how I install
it. I also don't know what libraries I need to be
able to write GEM programs. I have heard about
GEM++ and GEMLIB, but again I don't know what the
latest version are, where to get them or how to
install them.

Can anybody help me out and explain to me what I
need and how I setup a complete C++ environment
on my Atari so I can start programming?

I have also been looking at a program called ACS-Pro
which looks to provide some form of visual design
for GNU C++? Does anybody know more about this program.

Thanks all.

Regards,

Ben Hills.

That depends on the command that returns a value (the return value need
not be a boolean value). If you implement a command that returns a
boolean value, you should return a non-empty string (e.g. "1") as "true"

and an empty string (or a NULL pointer) as "false".

bye, Thomas

The latest gcc which doesn't require MiNT was the 2.7.2.3.
You also need at least the mintlib and gemlib. These you
can be found on several ftp servers (e.g. ftp.funet.fi).
The easiest way to install is if you have a MiNT
environment, than you have just to copy a few files to
their destination directories.

Feel free to contact me for more details, at the moment
I'm in the office and can't reach my atari (at home) to
give you more details.

Regards,
     Ralph

Only problem I have with it is the fact it's in German.

Atari ST programs actually :) I've already got a diasassembler for the Palm.
Yes,
Palm Pilot programs (PRC) do have different headers and stuff.

I've been having problems getting the program to show disassemblies period. I
open
up a file to disassemble and the little guy just sits there.

I was running it under Pacifist version 048. I simply ran the thing under TOSbox
and
it worked!

Are you going to disassemble Palm pilot programs? Do they have a particular binary program format (headers, symbol tables and such)? If these are different from Atari and cause difficulties, remove them with a binary editor, keeping only the code itself. TT-Digger accepts everything that is fed into it.

Interesting. I have a TT. I also have wintel laptop running Tosbox and/or Tos2Win,
I have seen it running with Gemulator and on a Milan. I further have a 1040
running
Tos 2,06.
I replaced tos 1.0 on that machine long before I started work on TT-Digger. :-)

Seeing as no-one has yet responded to this (or perhaps it's just that my
ISP's news-server hasn't received it yet), I'll kick things off with a
list of some of my current projects that I've worked on or am currently
working on:

1) Toolbox DLL manager. It hasn't been touched in the last year or so,
but seems pretty stable on the TT, ATM. I still have to write a decent
programmers manual for it, and tidy up a few of the bundled utilities

(Library lister, info viewer etc)

2) The stock control/invoicer program (tentatively called "Stocker") as mentioned in the now-deceased Atari Computing mag. I still have to work on printing out the invoices, stock-list, customer data etc. And write a user manual for it.

3) Get down to work on the Music OCR package that Brian Becroft mentioned to me some time ago. ATM, about all it will do is read in an image file (in IMG format, I think) and display it on screen in a window.

How does one determine the names/types of printers available under GDOS?

For example, I have two printers installed under GDOS (a 9-pin matrix and the SLM laser) . And I assume that I am not unique in this.

Obviously, I can walk through the range of GDOS printer ID numbers, and try to open a workstation for the device. That will tell me that there is *a* printer installed there, but not the *name* of the printer, so I can put up a menu of all the printers I find and get the user to select which one to use.

Or I can scan the ASSIGN.SYS file - but that only tells me the name of

the driver file associated with the device number - which may not necessarily match that of the printer (I could easily rename one driver to "WL67J3.R9E", and as long as it is correcly named in the ASSIGN.SYS file, I am still none the wiser)

There doesn't appear to be a VDI/GDOS call that tells me this (according to the Compendium, and Hisofts "Modern Atari Software")

: still program for these things?

Well I have written a few programs for the Atari, most of which are available via my WWW page at http://gem.win.co.nz/mario/ . I have lately released into the public domain the source code to a number of those programs although this is not mentioned on my WWW page. However an archive is available on my FTP site with the source code.

My most recent software projects were three games which came 1st, 5th and 6th place in the recent Magic game competition. You can get these from my WWW page.

I am not doing any more Atari software development at the moment, instead I am working on a number of hardware projects, also mentioned on my WWW page.

Not really that I know, but there is still alot of activity going on in
the TOS world. I just ordered my new upgrade for Calamus which is
reviewed in this month's Computer Shopper.

Thanks to everyone who has replied. I did find the source I was looking for (Ernest Schreur's homepage). I have Atari programs on tape I want to make a permanent copy of. This technology actually also works for a number of programs I have on handheld devices of the past that used cassette players to save/play programs in Basic. Cassette tape is not a reliable medium. And believe it or not, some of those handhelds are still superior in raw programming capability and number crunching to the current wince lot.

I know several who do. Probably lack of responce is due to people
wondering what good such a survey would do? ;-)

The reason I suggested a survey is because it'd be interesting to see how many people in this world code for the ST. Most of the programmers these days program for PCs and Macs.

Looking for the latest SysMon "System Monitor".

Anyone know if it is supported yet or some URL to author??

Thanks...

Do they still call it that. I thought on windows at least people just radomly slammed files together until something worked. Would explain the file size and stability at least. ;)

As a programmer though I sometimes find myself wondering the opposite question.

I'm a Win32 assembly coder right now and as far as I've heard, programmers seem to slack off on code optimization. Well, I'm not really that optimized of a coder either, but I'm trying :) I happen to also have an interest in the Atari ST.

If you've ever looked at the Win32 assembly world, that is one thing that we all complain about. You should see http://www.grc.com This guy really keeps his software small yet useful. There's also http://www.fastsoftware.com

How can I find out which process is currently "on top". I know
appl_search gives me all running processes, but it says nothing about
which one is on top. I have also looked through all of the Gemdos calls,
but found nothing there either. Any hints?

You could try:

wind_get(0,WF_TOP,&hdl,&owner,&below,&dummy)

This is AES 4

It would be nice, when there is no window open, to get at least the menubar owner.

Who knows?

menu_bar(0L, -1) will return the ap-id of the current owner of the menu
bar. The precesence of this feature can be checked via appl_getinfo(),
opcode 6. It works with MagiC as well, IIRC.

Ciao

Thomas

I've pondered the matter. I recall attempting all manner of methods.
They all failed bar pug's current one - in that Gem would behave
erratically (the older the version, the worse it was iirc) to a
greater or lesser degree. Essentially it boiled down to the
"connectivity" and "ownership" between the parent process's Gem
arrays, and that of the overlay.

Sadly I haven't a single concrete example but things such as this
would happen...

(1)
Messages would vanish: eg app under development would issue a redraw
to an "overlay owned" window and it'd work (as it should). Suddenly, a
week later, having added code, the app would break. Lots of debugging
later and I'd discover said message would be vanishing into a black

hole.

(2)
Program would suddenly hang/crash or simply ignore (some) interactions. Pug has "hooks" in it which allow an app to get involved with all the messages which pug handles automatically. One hook per automatic message. A hook is nothing more than a function pointer, default NULL, and therefore not jumped through by pug. Once an app shoves a value in there, pug starts jumping through it on receipt of said AES message, typically twice (once before pug handles it, once after pug has handled it).

This is a grand opportunity (scuse my french) for a ... big time f*ck up! Pug is already using the caller's stack (ie the app's) and now the app is piggy-backed on top of itself as it were. We could easily go spiralling out of control. Thus, whilst this kind of use is permitted, it is only documented as being useful for use by the app in situations where the odd global variable needs setting. The better solution is for the app's hook code, to tell pug not to handle the message. Pug then backs out of itself, right out into the applications "evnt_multi", where things can be dealt with in the usual manner.

Why am I explaining all this? Here's why...

During the course of development, of the "other methods"(*) tried, all showed erratic behaviour concerning the message origin. Pug doesn't have to handle all windows - an app might deal with its own entirely by itself. Yet, on occasion Pug would deliver such a message through one of its own hooks. Ditto the reverse, Pug would start passing back messages it ought to be handling. This behaviour had nothing whatsoever to do with Pug, after all - I could trap the raw AES messages, and they were just "quirky" (even appearing as owned by other programs - word processor, desktop etc). No wonder it crashed. Gawd knows who's resource file pug was getting access to!

In a nutshell, the problem was pug of course - but only in as far as initialisation was concerned. For all my mucking about I never had to change the pug code, just that darn "pugbind". Once you've got Gem to understand the two parts are one and the same thing (or two and separate) you're laughing. The most unfortunate thing though, is on occasion an initialisation problem can take weeks to show up.

(*)
Tried "hack 'n' slash" at the global[] array; also pug being the parent and loading the app; also straight "binary image".

> So when are you going to come back home and program some Atari
>stuff :)

I'd be tickled pink to have the chance to do *any* programming. Just too darned exhausted these days, same as yourself it seems. Just look how long it's taken me to reply here!

> Come on you know you want to do it!

Hehe! I have *tried* to get GCC working. Ignoring the above, for
better or worse, I'm into C++ now. :-)

Hi Folks,

I've banged the lot on my website. Forgotten the url already. Go to
homepage then click on [Atari][Programming][PUG]. Have also made a
feeble attempt at documenting how it gets compiled.

Whilst the entire pug sources are there, the library sources upon
which it depends are not. Will take me a while to figure that one out.
Most likely I'll end up posting the sources for all my libraries.

Note:

Version 0.9 was an interim version which consisted of V0.8 unchanged;
plus stuff I was working on for GFA users to be able to access pug
data; plus a load of stuff for rendering fonts into OBJECT's
(unfinished sadly); plus I ripped out most of the docs prior to a
"release rewrite"; plus I stuffed in a slow but reliable high level
memory manager (a kind of C++ 'container object') that was never meant
to live there permanently; plus other bits I've long forgotten.

V0.8 would have made a better source code release but V0.8, along with
lots of other sources, was stuck in one of a set of LZH archives which
accidentally got password protected.

Hi,

i started a thread at the atari.org forum
(http://forums.atari.org/list.php3?num=3) about porting the rc5client to
the Atari platform. One guy did try to assemble the core and it worked
great but now he needs help with the C part. Could one of you guys help
him out, because sadly i cannot (never got better than modifying some
"hello world" stuff :-(( ).
Any help would be greatly appreciated.

Thank you, bye.

Ronald

An AUTO folder program I started writing in 1992 to allow ST apps to load/unload libraries of useful code as and when needed.

Essentially it's a "DLL manager" for the ST.

As you can probably tell from the 1992 start date, I haven't exactly prioritised the development of it.

However, it does have quite a few features:

- Libraries can be loaded at boot time (by setting a "boot me" flag) if you want it to be loaded then.

- There are two types of library - system and user. System libs are essentially for system related tasks (drawing 3D objects, talking to hardware etc), whereas user libs are for user tasks (calculating profit margins, dithering an image, etc)

- Libraries are loadable by applications at any time.

- One can ask if a library is loaded, and link to it. (I still have to work on the code for when the app that loaded a library crashes, and another app is still using the lib)

- Libraries are essentially normal GEMDOS executables (unlike the special rigmarole you must go through to create a CPX [prepending a header])

- Library calls are similar to XBIOS/GEMDOS calls (placing data on the stack, then a function number and issuing a 68k TRAP instruction). However, one must also push a library handle onto the stack, and a magic number is placed in a register. AFAICT, it works OK under MiNT with memory protection activated(I've tried MiNT versions 1.04, 1.12, and 1.15 on my TOS 3.05 TT)

A sample session in C:
(I still need to work on this a bit, it doesn't feel quite "right", but you should get the idea)

```
#include "0/tlbx.h"

int main( void )
{
    TlbxInfo tlbxinfo;
    TlbxLibInfo tli;
    LibHandle lh;

    // check if toolbox is available
    if( xtlbxInfo( sizeof( tlbxinfo ), &tlbxinfo ) == 'tlbx' )  {
        // check if library is available (normally one would load it if
it isn't)
        if( lh = tlbxLibAvailable( LIBTYPE_USER, "Hello", sizeof(tli),
&tli ) )  {
            // call a func within the library
            helloFunc( ... );
        }
    }

    return 0;
}
```

now the same thing in assembler:

```
main:
    pea    tlbxinfo
    pea    tlbxinfosize
    move.w    #'tb',-(sp)
    trap    #14
    cmp.l    #'tlbx',d0
    addq.w    #4+4,sp
    bne    notoolbox

    pea    tli
    pea    tlisize
    pea    libname
    pea    LIBTYPE_USER
    pea    (0<<16)|LibAvailableFuncNumber
    move    #TLBXMAGICNUMBER,d1
    trap    #0
    move.w    d0,d7
```

```
    add.w    #4*5,sp
    blt    libnotavailable

    pea    data
    move.w    #hellofuncnum,-(sp)
    move.w    d7,-(sp)
    move    #TLBXMAGICNUMBER,d1
    trap    #1
    addq.w    #2+2+4,sp

libnotavailable
notoolbox

    moveq    #0,d0
    rts

    DATA
libname
    dc.b    "Hello",0
    even

    BSS
tlbxinfo
    ds.b    tlbxinfosize

tli
    ds.b    tlisize

    END
```

> A sample session in C:

Whoops - this was for a very out-of-date version (and it wasn't the best example either). Sorry.

Here is a better (albeit simple) example - a "Hello World" using a loaded library (I wrote this while online [using SatanSoft's IE on the PC], so please forgive any typos/style errors)

```
#include "0/tlbx.h"            // Toolbox funcs and types
#include "0/types.h"        // for "sint16"

#include <stdio.h>        // for printf

int main( void )
```

```
{
    TlbxInfo tlbxinfo;    // info about the toolbox
    sint16 libhandle;        // library handle [negative = error]
    TlbxLibInfo libinfo;    // info about the loaded/linked-to library
    sint16 loaded = 0;    // "did we load this lib?' flag

    if( xtlbxID( sizeof( tlbxinfo ), &tlbxinfo ) == '_tll' )  {
        libhandle = tlbxLibAvailable( "Hello", sizeof( libinfo ),
&libinfo, LIBTYPE_ALL, 0 );
        if( libhandle >= 0 )
            libhandle = tlbxLibLink( libhandle );
        else  {
            libhandle = tlbxLibLoad( "hello.tll", sizeof( libinfo ),
&libinfo );
            loaded = 1;
        }

        if( libhandle >= 0 )  {
            printf( "%s\n", helloString() ) ;

            if( loaded )
                tlbxLibUnload( libhandle, sizeof( libinfo ), &libinfo );
            else
                tlbxLibUnlink( libhandle, sizeof( libinfo ), &libinfo );
        }
    }

    return 0;
}
```

(I'll not attempt to write an assembly-language version of this example - I wasn't thinking properly when I did so last night [the PC has that effect on you])

As you can see, it looks to see if the Toolbox is loaded. If so, it then uses it to look for the "Hello" library. If that library is loaded, it links to it, getting back a possibly different handle to it. If it wasn't already loaded, it loads it. If the handle was negative then the link/load failed. Otherwise we then call the "String" function within the library to get back a string to display via the C library call "printf". Then we either unload or unlink from the library as appropriate, and exit the program.

Sounds like an interesting idea. Did you do Windows programming by any
chance? It sure has a windows DLL'ish feeling to it.

No - I haven't done any real Windows coding. Most of my programming has
been on non-PCs over the last 15-odd years (much of which has been Q&D
utils for the ST and TT).

I am, however, currently learning how to write Windows apps on a PC that
was very kindly given to me, so I can take part in a potentially good
moneymaking organisation writing Windows code for certain tasks.

(I am slowly working my way through an old copy of Petzold as part of my
Windows learning process, finding the odd bug/inconsistency in the
presented listings, and reorienting my brain from the higher-level and
better organised GEM mindset to the "can't be bothered making the OS do
this, so we'll make the apps do it instead" mindset that seems to crop
up in Windows programs)

I have, however been reading a number of computer mags (most of which
are now very PC-oriented) and took my inspiration on how to write the
Toolbox from some of the articles and listings therein.

I also used a few of my own needs/wants when writing it.

Why not just compile it, load it into memory, relocate it using the
relocation table, and then save the result?

Ciao

Thomas

Thanks for the information I got under "Processes under Magic", it was very useful! Since then two new problems have come up:

1) I use appl_search() to get all the running processes, but when one of them gets 'frozen', it can no longer be found with appl_search(). I have downloaded the latest online Magic programmer documentation, but haven't found anything in there either.

2) I need to know the amount of memory a process uses. Prusage() should do it, but it only seems to work under MiNT. I haven't been able to find any other system call in the Magic programmer docs either.

Thanks for any help.

Regards,
Torbj►rn Gild►

Look at the size of the process' entry in u:\proc (if MagiC has this).

What you need to do is modify and re-assemble PCSTART.S in the LIB
folder. Pure Assembler DOES support absolute addresses.

Hi all !

Great ! If i understand, I just need to modify my pcstart.s to add an
ORG
directive and that's all.
I will try that...

Thank
laurent

Actually, all you have to do is set the absolute addresses under the
Options/Linker dialogue. This will also create an absolute address
executable header.

(I forgot about that earlier.)

Hi everybody,

Is there a legal way to redefine the keys with ALT held down, the way we can redefine all the keys with keytbl() [XBIOS(16,...)]? I mean a way without bending any vector.

See you later,

Hi, I've seen a can work with PureC with MagiCMac6, but I have problems with the PureDebugger. It freezes when I try to watch/inspect variables.

There should be a patch around, can you help me sending to my email address please ? Thank you very much.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

the first of the 7800/2600 monitors carts have come in,and we are
notifying every one who is on the want list,as they come in,if you
receive a e-mail from us,please respond a.s.a.p.,we will not hang on to
your product for very long,only a limited number are availible,to
refresh any ones memory,this is a low end developement kit for the
7800/2600 game machines,and comes with very extensive documentation,the
manual is over 200 pages long,this is a actual atari liceinced

product,and was the last official liceinced product for the 7800/2600,we
at video 61 have aquired the rights to this very rare product,and have
worked very hard to get this on to the market,if there are any
addictional people who may have missed this announcement,please call or
e-mail us to see if you can be put on a reserve list,if we turn out to
have a few leftovers,our phone number is, 651-462-2500 our web site is,

I don't see why it would not, worst case senerio is you may be forced to
to use an old ST mode to make the editor work. However what you code
and compile would not necessarily have the same problem, depending
on your own code of course. ;-)

Hi!
I'm trying to compile a self-made unit in Pure Pascal 1.1 and can't find out how to do it. I had to give the file a name before writing it, and i called it "ppu" right from the start. This does not seem to be the (only) fault, though.
All the entries under "compiler" are grey when I'm in the editor with this text.
Anyone able to give a hint to a beginner like me?
Claus

From the GFA-Basic Manual :-)
Hope this helps...

BASEPAGE
HIMEN

In the variable BASEPAGE is the address of the Basepage of the GFA-Basic Interpreter, BASEPAGE is a 256-byte long storage area as follows:

Bytes	Contents
0 to 3	Address ofthe start of TPA (Transient Program Area)
4 to 7	Address of the end of TPA plus 1
8 to 11	Address of Text segment of the program
12 to 15	Length of the Text segment
16 to 19	Address ofthe Data segment
20 to 23	Length of the Data segment
24 to 27	Address of the BSS (Block Storage Segment)
28 to 31	Length ofthe BSS
32 to 35	Address of the DTA (Disk Transfer Address)
36 to 39	Address ofthe Basepage of the calling program
40 to 43	Reserved
44 to 47	Address of the Environment Strings
48 to 127	Reserved
128 to 255	Command line (first byte specifies length of command text)

The variable HIMEM gives the address of the first free memory location not used by GFA-Basic. This is normally 16384 bytes below the screen area.

Example:

```
    a%=LONG{BASEPAGE+&H2c}
    DO
      a$=CHAR{a%}
      EXIT IF LEN(a$)=0
      PRINT a$
      ADD a%,SUCC(LEN(a$)) ! SUCC() = next higher integer
    LOOP
```

--> Here the complete BASIC Environment is displayed.

Memo: This pointer should be avoided. If you need additional ram see

MALLOC().

A sourcefile should be given a name like "anything.pas", which will then be
compiled to "anything.ppu"
Not having the .pas extension is the cause of the greying.

I just wanted to let people know that I was able to sneak in a quick mention of the Atari 800 in my latest article. It is nothing big, but I write for "PC AI" magazine (www.pcai.com/pcai) and my latest article, "Exploring MARS: An Alternative to Neural Networks" appears in the Jan./Feb., 2000 issue. In it, I described MARS, which is a machine learning tool. The bit about the Atari is that I ported a trained model ("memory") from MARS (which runs on Windows) to the Atari. The point I was trying to make is that often, even older (!) hardware can support advanced programming techniques.

je suis tr□s content d'avoir re□u tes r□ponses
j'ai r□pertori□ ces bugs sur Draconis 1.6.3 :
- selon la r□solution graphique du Milan les images ne s'affichent pas ou
alors uniquement en mode optimis□.
- si sur certains sites la gestion de formulaire marche (www.altavista.com)
sur d'autres elle est vraiment calamiteuse
on a droit un joli bouton validez mais rien ne se passe qd on clique dessus
- qd on clique sur un champ de saisie d'un formulaire on a pas le temps de
saisir et il part avec un champ vide
- ds la gestion des ancrages HTML il suffit qu'on en est
plusieurs sur la ligne du style
abcd
et bien si on clique sur b,c ou d c'est comme si on avait cliqu□ sur a
- des plantages qui courcicuitent meme le CTRL ALT DEL heureusement que l'on
a un bouton de RESET
- qd on a affaire a un URL de ce type tri.htm?chaine= il nous sort des
erreurs de syntaxe
A part cela je suis qd meme content de pouvoir consult□ mes mails sur mon
ATARI !!
Une am□lioration qu'ils peuvent faire c'est qd ADAMAS trouve une erreur de
syntaxe
il faudrait pouvoir choisir entre de continuer a rester a executer cette
page ou rester
la ou on est
Cela serait super !
A +
Olivier

Soviel zum Thema "Warum soll ich nicht wild zwischen Newshierarchien
crossposten und das auch noch in meiner Muttersprache?"

S►►er, comp.* is an international news hierarchy, maus.* is a German
language BBS top level hierarchy, hence your choice of language (or
choice of newsgroups) is far from being acceptable, for the modern
lingua franca is _not_ French, but English.

Thorsten

F'up2 set to that fr.* group.

good morning !!
Milan 040 / 32 Megas
French User
bugs :
1. when loading page the system crashes and the hit on CTRL+ALT+DEL becomes
inoperant
2. on the website www.yahoo.com the input text is affected to a link , when
i click to modify it i can't do it
and adamas starts an other page saying me that i make an error
3. could you modify the error messages of syntax error , style internet
explorer . if adamas is finding errors
you will be able to ask you if we want to continue with this page and an
option for desactiving of the control
4. i am not sure that is on www.yahoo.com but i view a bug like this :
<A href="a">a
<A href="b">b
<A href="c">c
<A href="d">d/a>
if i click on b,c,d it is the same thing if i have clicked on a
5. if a site make time to answer , you could put on adamas a message
who prevents us if we would continue or stop the transfer
i am waiting for your response ASAP

Where can I find a ROM dumper utility for an Atari 1040ST?

I have downloaded Gemulator and I also downloaded 2 versions of
the Atari ROM- 1.4 and 2.6 from
http://www.lgd.fatal-design.com/. All of which work fine with
some Atari programs but I'm having no luck with Megamax Laser C
which crashes my Pentium.

So, the author of Gemulator suggested getting a dumper utility
to download the ROM from my own 1040ST which still works.

I wouldn't know, but surely the Falcon doesn't have any Y2K problems? Mine
doesn't anyway.

Cheers!

James

I can understand why Laser C crashes your emulator. Compilers are
usually very designed very specifically for the architecture. Is there
some reason why you would want to run your Laser C programs under the
emulator?

If you know about C compilers I suppose you also know how to setup a
newsreader properly: Turn off the html rubbish!!! And while you are
busy with this, try learn how to quote properly.

Check your ST's TOS version. If it says 1985 it's 1.0, 1987 is 1.2 and 1989 is 1.4 and download the same version. Really no need for a dumper utility as most TOS versions are available.

Start the emulator in "Atari disk mode" and set it up to boot from floppy and in monochrome. Now put in your normal boot floppy from the real ST. Keep any original floppies writeprotected as Win-95/98 also writes to the floppy when reading (SIC!).

If this does not work then you are probably out of luck. Gemulator 2000 is generally very good but you may also try a more "games oriented" emulator. Sorry, I don't remember any names.

Newsgroups: comp.sys.atari.st
Subject: ? Settime, Tsetime, setftime & Pure C on ST ? (119 years)

as i don't have a realtime-clock on my 1040ST (2.06eng)
i've written a little c-prg that reads out the creation-date of itself,
shows it on the screen (e.g. at boot-up) and lets me inc/dec the
date according to the actual day and sets an updated creation-date by
means of "setftime()" (to remember it next boot-time) this all works fine !

now i send this date to "Tsettime()" to set the internal GEMDOS date.

but e.g. 14.1.2000 on the file gives me 14.1.80, or 14.1.28 in
the xcontrol.acc.

even setting the xcontrol to 14.1.00 did set back the year to 1980/2028
after exiting an application.

even using the XBIOS Settime (all from pure c 1.1) doesn't sove this.
i had a similar tool runnig before 2000 and it worked !
it cannot be a y2k as it's just an offset to 1980.

furthermore i wonder why Tsetdate has 7bits for the year, but the
(german) "Atari Profibuch" states that year can only be 119 max !
where are the other 9 are left.

regards

I read somewhere that the GEMDOS Fsfirst function only supports up to 20

characters for the masked filespec argument.
Is this true?
Is this limit (if any) extended by MagiC (VFAT) or MiNT (VFAT or MiNT domain)?

Oh yeah and I know I should use Freadir, etc. :)

Hi!
First of all, you should email to the Draconis-Support instead using the
maus.computer.atari.software forum for Draconis Bugreports.

1. when loading page the system crashes and the hit on CTRL+ALT+DEL
becomes inoperant
a) Which web page? Please specify it as good as possible to make us able
to reproduce the errors.
b) What happens on a System when a program crashes is not affectable by
us.
   Most crashes on Adamas are Bus-Errors, and if the Milan-TOS does not

react of
   CTRL+ALT+DEL anymore after this there is nothing we can do...
2. on the website www.yahoo.com the input text is affected to a link ,
when i click to modify it i
can't do it
and adamas starts an other page saying me that i make an error
The bug is known and currently under examination.
3. could you modify the error messages of syntax error , style internet
explorer . if adamas is
finding errors
you will be able to ask you if we want to continue with this page and
an option for desactiving of
the control
You will be able to deactivate the JS Error-messages in the new 1.7
version.
4. i am not sure that is on www.yahoo.com but i view a bug like this :
<A href="a">a
<A href="b">b
<A href="c">c
<A href="d">d/a>
if i click on b,c,d it is the same thing if i have clicked on a
We know one website where this error occurs too, but we are still
searching for the reason.
5. if a site make time to answer , you could put on adamas a message
who prevents us if we would
continue or stop the transfer.
The problem on version 1.6 and earlier is the blocking
"GetHostbyname"-Call, so the System will not be able to do anything
unless the funktion came back with the IP-adress or timeout.
i am waiting for your response ASAP
You have luck I read your posting anyway, if you want an answer for
problems I strongly recommend to email to the Draconis-Support!

My Atari is getting long in the tooth. I suspect it may die any
day. Also, I did a lot with Laser C before my Atari hard drive
crashed and rather than buy another Atari hard drive- it seems
sensible to do it all on a PC in emulator mode- until I can
learn MS Visual C++, then convert the programs written on the
Atari for my consulting business. The author of Gemulator swears
it works. Whenever I write him a message telling him it doesn't,

he bitches that I dare complain while telling me- insisting that
it works. What an asshole. I hope he's reading this. <G>

Thanks, I'll give that a try. At least your message was an effort to help
unlike any of the dumb ass messages I got from the author of Gemulator-
sarcastic messsages about how great his program is, with no help.

Hi I am a demo coder adn musician on the PC scene, but I'd liek to give my old
ST the treatment that it has lacked for a few years, does anyone know where I
can get hold of a copy of c/c++ that allows inline asm code, and an assembler
for the ST. I could also do with some tutes for 68000 asm coding.

Thanx

Hi,

I have two SLM804 printers gathering dust in a corner since I do not have any Atari system. I'd like to have any programming info available on those printers, especially the connector's pinout (I also have the SLMC804) because I want to use them on a PC. Maybe even write a Linux (or Ghostscript) driver for it.

Thanks.

Are you sure you can do this, I maybe wrong here, but didn't the SLM804 rely on ASCI and ST RAM to work?

Precisely, so it cannot be done easily.

    Welcome!

> can get hold of a copy of c/c++ that allows inline asm code, and an assembler
    For C++ there is only GCC which uses its own (ugly) assembler syntax
and is deeead slow on a ST.
    For C, SozobonX allows inline asm I think (not so sure):
http://ftp.lip6.fr/pub/atari/Programming/, then get soz*
    Anyway you can always do object linking instead (not very practical I
agree)...

... but you should consider using only assembler, as there are some very
practical integrated ASM "environments":
 - Turbo Assembler (the best for 68000, alas deutsche Doku):
http://ftp.lip6.fr/pub/atari/Programming/tuass177.lzh
 - Assemble: http://wombat.ludvika.se/ae/dhs_files/misc/assemble.lzh
 - Devpac 1: a bit old but still usable (current is 3.10, NOT freeware
:(...). But I dunno where to find it.

    Others are commercial or too old to mention or unknown to me!

> for the ST. I could also do with some tutes for 68000 asm coding.
    Very nice:

I think they were manufactured by QMS<?> and also made for other platforms.
I can't recall the exact model of QMS, but you should be able to find
drivers and support for them.

This cannot be done. The SLM printers don't connect to the parallel port, but to Atari's proprietary ACSI port. They are designed to work with an Atari only, since they use the ST's RAM. This was Atari's way of providing a cheap laser printing solution.

There is a software solution that allows you to print to an SLM by using an Atari ST as an interface. The ST must have at least 2Mb of RAM to run an SLM printer.

In any case, it is probably not worth it. You'll be very lucky to find cartridges for this printer, and the quality is not up to that of a modern deskjet type printer.

It is not only a question of connecting wires but also of timing of
the signals. What outputs does your computer have?
I took a quick look in the SLM Atari manual: pixel data comes in
serial with clock and there are a lot of other signals (paper empty,
toner gone, printer not closed, not ready, heating up etc.) needing
to be reacted on (in time!).
I do not think that you will be happy trying to have your computer
listen en send those signals.
But find some die-hard Atarians to make happy with the printers!

I think the mechanism was for most of them TEC (Tokyo Electric
Company). But there were also Cannon drives in use for a while. With
different signals going in and a different interface with same
name/number but not-exchangable!

I once had problems with a Falcon-interface for this printer.
The german makers of it also did not know about this hidden fact. And
I had such a Canon SLM 804!

I guess you are using the free Gemulator 2000? If so I would not expect any real support at all! And it is well known that Derek is not really very polite :-) But his program is actually very good and free, so I suppose he has the right to behave as he likes. And it's very likely that your compiler is doing something illegal not (yet?) "covered" by the emulator.

Actually I too had problems with Gemulator-98 freezing my pc so I had to press the reset button. I did upgrade to the latest Directx drivers 7.0a (?) and the new Gemulator-2000 and since then it works OK.

Also the latest STinG (Atari tcp/ip kernel) no longer runs with Gemulator. I think it's about the handling of serial in/out-put buffers not behaving like on genuine Atari hardware.

The same goes for other [hardware] emulators like the Milan (aimed at those who dislike discussions about emulators in the group!). Most old programs works but some don't.

Hmmm ... this will be hard work! The SLM804 (a page-printer) is designed to
use the ST RAM to prepare the page image prior to printing. So, you not only
need to emulate the printer interface but also the DMA (store-access)
interface. Good luck!

Roger

Dont use c code for demos on st.. theres no reason for it.. its slooow and
not useful for demos..

get devpac 3.10 or so.. and take a look at latest ucm discmaggie (#18) for
info about 68000 coding..

all info and files (apart from devpac) are available on dhs site..
http://wombat.ludvika.se/dhs (as mentioned)

Hello!

> I read somewhere that the GEMDOS Fsfirst function only supports up to 20
> characters for the masked filespec argument.
> Is this true?

No, it only support 8+3 Filenames. Look at the definition of the DTA
structure.

> Is this limit (if any) extended by MagiC (VFAT) or MiNT (VFAT or MiNT
> domain)?

No, you can't read long filenames with Fsfirst/Fsnext.

> Oh yeah and I know I should use Freadir, etc. :)

Yes, the only way. The use of Fsfirst/Fsnext is strongly deprecated under MiNT/MagiC. Fsfirst/Fsnext is only for compatibility reason available.

The bad news is that you won't be able to use these printers on a PC, at least not directly.

Atari's way of printing to their laser printers involved building the page image *in the Atari's memmory* and sending that as data to the printer.

This means that you *must* have an Atari (1-2Mb) to use one of these (or the 605) printer. Assuming that you can get one, then you can use a utility prog that's available on my web site (follow the translated apps link) that will let you print from any other computer to the SLM through the Atari, using that computer's HP printer driver set to print to serial port or disk

file. I have to say that you would be better off buying a standard printer.

The SLM804 uses TEC LB-1301 drums.

I' like to connect the SLM to an PC, too. But I dont't do it,, because I own
an ST with a PAK accelerator.

I think the easiest way to use a SLM804 Laser with SLMC804 Controller is to buy an old Mega ST with 4 MB and maybe a SM124 monitor (if you don't use an TV set) and a small harddisk.. It should cost less than a new laser printer.

On this computer you have to install an Diablo SLM emulator (archives similar to diab630 or SLM1_4) at
http://www.muenster.de/~reschke/
to use the laser like a printer connected to the centronics parallel port.
You may install GEM Ghostscript gemgs from
http://www.tu-harburg.de/~smcf1605/ (actually moving). The SLM-Driver of gemgs uses the emulator for outpout onto the ACSI-Port.
On linux you have to install lpr (I think) and SLMtool s from the linux-m68k archive tree. Ghostscript is newer in Debian Linux Distribution than in the m68k archive.

we are pleased to report that the very rare,and elusive 7800/2600 monitor carts are in stock now,if you were on the reserve list,you should have received a e-mail from us stating this fact,with ordering information,if you did not receive a e-mail,please contact us a.s.a.p.,for this is a limited time offer,and qauntities are very limited.
if you are interested in one of these actual licensed atari product for your collection,or use,please contact us now,we may have a few left,but time is of the essence.
the list price on this item is $99.95,this is a low end development system for your 7800,it will allow you to develop your own 2600 game,and store it in a 8k battery backed up ram,or 16k battery backed up ram for the 7800,it is cartridge based,using the 2 joystick ports of your

7800,and the 2600 keypads/touch pads,or sesame st. controllers for data input devices.
this cart development system also comes with a 200 page developers manual,and schematics of the7800,also it has 3 2600 games on board,also with a demo of a unreleased 7800 game on board. ordering information can be found on our web site at, www.atarisales.com
thanks,
lance

X-Hardware: 68030/32 Atari TT
Organization: Tripnet AB
Newsgroups: comp.sys.atari.programmer

I'm trying to read the 6 bytes time/date from the keyboard processor
with some GFA code I got from somewhere, but all I get is 6 zeros.

The idea is to let the clockvec from xbios 34 (Kbdvbase) point to the
short code in machine_code$ to get the address where the 6 bytes will
be stored, copy them to a safe place (in data%(2)) and restore the
original clockvector.

This routine assumes that the pointer arrives in A0 but my old "Atari
ST Internals" says D0 (move.l d0,*A%) wich does not work either.

Any better solutions or comments?

```
DIM data%(2) ! 12 bytes, plenty of space for the clock.
LET data%=VARPTR(data%(0)) ! Address of it.

Here is the code:
'
address%=0 ! Place to store the address of the clock packet.
machine_code$=MKI$(&H23C8)+MKL$(*address%)+MKI$(&H4E75) ! move.l a0,*A%   rts
vector%=XBIOS(34)+20 ! Old clockvec location
```

```
old_vector%=LPEEK(vector%) ! Old clockvec value
LPOKE vector%,VARPTR(machine_code$) ! New clock value
address%=0 ! Clear value (just to be sure).
OUT 4,&H1C ! Request a clock value
REPEAT     ! Wait for Interrupt
UNTIL address%   ! (Until an address is present in A%
BMOVE address%,data%,6 ! Move it before it gets overwritten
LPOKE vector%,old_vector% ! Restore old vector
'
CLS
FOR i%=data% TO data%+5
  PRINT ASC(CHAR{i%})
NEXT i%
```

How can a copy of a patched ROM that has been transfered to TT ram (Ala Afterburner Tool Kit) be saved to a file? I'm pretty ignorant when it comes to addresses and such, so please walk me through saving the ROM image, and what to tell the Electronics guy who is going to burn a new ROM for me what to do with it.

I noticed the ROM for the Falcon has 4mb capacity, but TOS only occupies a small portion. Other than having them available at boot up, would there be any benifit to having other applications placed on ROM and accessable through a CPX or something when booting off a floppy? HS Modem? JPGDSP?

TIA,
Mike

Hi you all.

I wrote a routine 'find_cancel_button'

I have seen 'Cancel' & 'Abbruch'.

What are the most common used equivalents in other languages?
Actually used by Atari programs that is.

Case doesnt matter.

Thanks.

I too have a 1040STe + TOS 2.06 and am having trouble with TSETTIME.
It seems to boot up with date in hex of '6000' (0/0/2028), and I wrote
a small assembler prog. to set it to '2839' for example (25/1/2000),
but then TGETDATE returns '6039' instead (25/1/2028). Very strange.
I thought these things were supposed to be year 2000 compliant?
Gary.

Officially nope. But some guys in Poland made modifications of German (I think) TOS.
Anyway, many programs were also translated to Polish.

quite the same what i did - makes me not really happy that we're already 2
(;

> but then TGETDATE returns '6039' instead (25/1/2028). Very strange.
drove me almost mad - especially when you rely on documentation !
i am certainly not going to disassemble the TOS for that ... *sigh*

> I thought these things were supposed to be year 2000 compliant?
somehow it cannot be un-compliant ! how should it !?
2000 would be dez 20 - the offset to 1980 i.e. $14 where could the TOS
go wrong in that !?

Without a patch to the XBIOS the clock on all Atari machines without a
built in RTC isn't y2k compliant.

Philip Taylor wrote a detailed description about this last March in
article Message-ID: <7cirnskps1@plug.news.pipex.net>. If you can
persuade deja.com to display it, it describes the reason for the failure
quite well. Another useful site, and one where you can (possibly) get
the required patches is John Whalleys page at

http://www.whalley.demon.co.uk/atari/y2k.html

thx a lot, perhaps there's a chance:
quoting from http://www.whalley.demon.co.uk/atari/y2k.txt

- start -
The XBIOS problem is such that dates after 1999 will not be handled correctly
by the following XBIOS functions:

```
          Trap#14 - Function #$16   Set 32-bit DOS format date & time.
          Trap#14 - Function #$17   Get 32-bit DOS format date & time.
```

For years from 2000 to 2059, the consequence is that the date part of the
SetDate&Time function is ignored and the GetDate&Time date part return
value remains unchanged from when it was last successfully set.

For years from 2060 to 2107, the GetDate&Time date part return
values are from 2028 to 2075 respectively.

The good news is that the GEMDOS Trap #2 - Date and Time functions
work correctly.
The bad news is that a lot of programs use the XBIOS functions and those
programs that do so will need a patch.
- end -

i'll give it a try by using the gemdos directly.

Yes.

There's a 28 byte header (drihdr) which includes a magic number
($601A), the sizes of the remaining segments and the program flags
(FASTLOAD etc). It's followed by the text and data segments, the
symbol table (not used), fixup table (converts all absolute
addresses) and (optionally) debug data (also not used).

>Does anyone have any information about the .PRG file format on the ST/STE ?

Here's the (limited) info I have about it.

Offset (hex)	Size	Contents
000000	2	0x601A (bra.s *+0x1A) jump to start of text segment.
000002	4	length of the text segment (program code)
000006	4	length of the initialised data segment
00000a	4	length of the uninitialised data segment
00000e	4	length of the (debug) symbol table
000012	4	reserved
000016	4	reserved
00001a	2	reserved
00001c	?	start of text segment

The format of the symbol table is as follows:

Offset (hex)	Size (bytes)	Contents
00	8	Symbol name, upto 8 chars, null (0x00) terminated if less than 8 chars
08	2	Symbol type
0a	4	Symbol value

Normally programs are compiled/assembled as relocatable code and, therefore have all offsets relative to 0x000000. The relocation table is a byte array used to convert these offsets to the correct addresses, with the first 4 bytes representing the offset to the first absolute address. Each byte represents the number of bytes to the next absolute address. Some values have special meanings and these are as follows:

0x00	flags end of the table
0x01	add 254 bytes to the pointer and read next byte in relocation table.

Note. Odd address offsets, i.e. 0x03, 0x05, etc. are illegal and are likely to show the table has been corrupted.

RADWAR PARTY 'Demo Competition' in May 2000
1st price: 3000 German Marks (1500 Euro)
2nd price   2000 German Marks (1000 Euro)
3rd price   1000 German Marks (500 Euro)

read on ...

Dear Demo-Coders,

we would like to setup a demo competition at the RADWAR Party 2000.

But we would not like to organice a simple, normal and usual competition.
You have already seen them a thousand times, therefore we invented somewhat
special.

You ask why, ok here are the answers

1. We do not have the time on the party to organice for each computersystem
a separate competition.
The party would be interrupted too much, because mainly we want to celebrate
and booze.
You can watch a computer monitor at home for the wholy rest of your life.

2. Normally everyone wants to program the demo with the best effects. In
addition always 3D Routines, grafix and music can be seen. However it's very
hard to compare one demo with another. Each individual program has evenly

its special characteristics.Therefore we have decided to give you a certain topic. This has to be coded by the programmers on the machine, where they have the best knowledge on. Hereby we want to achieve, that also a DEMO on a Commodore C-64 with many ideas and humor, in the overall view ,can be better than a DEMO on a 700 MHz strong Pentium machine with 32Meg of VGA memory and a Sounblaster Live experience.

Rules:
In order to deal with the problems of technique, the DEMOS should be recorded on a VHS video tape. On the party the DEMOS are then shown on large video monitors and also viewed to the wall by a video beamer. Therefore the demos should be send to us until at least one week before the party. A video tape with your one recording of it would be best. A CDROM or a diskette must be attached as proof of programming.

As a topic or storyboard for the demo we did not commit ourselves yet. However we already made some thoughts, which we want to indicate to you gladly.

For example: ' Little party People ' following the very successful game ' Little computer People ' from Activision. The game was developed for Commodore C64 and Commodore AMIGA. We thought of a kind of conversion of the party atmosphere in a Comic style. You see the party space in several levels and you can watch the partyfreaks doing their activities.

Szenario Ideas:
Drunken Freaks are fighting the security, dancing Cracker in leathertrousers, naked girls on stage, GoGo dancers with their LiveAct or the big eating at the food buffet.

These are naturally only a few ideas, you should free your on phantasy for the storyboard of your demo.
If the whole thing will then provide good acoustic output and speech blisters as in a Comic, then the evaluation of the demos will surely be more interesting.
All guests at the party will watch the show for sure, even the real AMIGA and C-64 fans, that would normally not look at a PC Demo, cauze they hate PCs.

And as a matter of fact, there will be good prices to win

1st price: 3000 German Marks
2nd price 2000 German Marks
3rd price 1000 German Marks

And all the others will get special prices like software and hardware, no one will loose thiz way.

What do you think abou thiz ...

We are awaiting your feedback very soon, cauze the time is already running ... party time is coming
closer and closer.

Thank you for your attention,

MWS of RADWAR

Hello everyone!

Well, I'm a beginner. I bought Pure Pascal 1.1.1. I bought a book "Turbo Pascal 7.0. The compendium" (German, Markt & Technik, 1993) because I read that they are compatible.

Let me tell you that I'm not posting this lightheartedly. I've been trying to solve this on my own for two weeks, thinking I've overseen something very smallish and simple somewhere.

What is the reason why THIS doesn't work in Pure Pascal:

```
PROGRAM readinttest;
uses crt;
var  i    :    longint;
     n    :    word;

PROCEDURE readint(var zahl: longint; anzahl: byte);
var  eingabe, puff :    string;
     cf                 :    text;
     savex,savey        :    byte;
     contr              :    integer;

begin
     if anzahl>11 then anzahl:=11;
     assigncrt(cf);
     settextbuf(cf,puff,anzahl+2);
     reset(cf);
     savex:=wherex;savey:=wherey;
     repeat
          gotoxy(savex,savey);
          clreol;
          readln(cf,eingabe);
          if savey=lo(windmax)+1then dec(savey);
          val(eingabe,zahl,contr);
     until contr=0;
     close(cf);
     gotoxy(savex+length(eingabe),savey);
end;

BEGIN
     n:=1;
     repeat
          readint(i,n);writeln(' **** ',i);
          inc(n,2);
     until n>12;
     write(^j,'<ENTER>'); readln;
end.
```

I'm sorry for this long posting. But this problem stops me completely.
Please forgive the "german-ish" names for variables.
And Thanx in advance.

Hello,

I was checking through some old boxes and I discovered two items left over from when I owned an Atari 130XE. One is a nealrly new condition Radio Shack joystick, with autofire. I remember buying it for $14.99 but I'll let it go for $4.99 plus shipping USPS.

I also discovered a 1983 mint condition "Hackerbook for your Atari Computer" by H.C. Wagner that was written for the Atari 400/800 and mentions how to make a bootable cartridge and how to create an Atari Eprom burner from game ports 1, 2, and 3. It also mentions how to create a serial port or a parallel port from game ports 3 and 4. It includes the source code listings in the text. I think it cost $7.95 new, so I'll let it go for $2.99 plush shipping USPS.

Let me know if you want one or both items.

I seem to be having some trouble connecting to my Internet Service
Provider (ISP) lately using PPPKIT with MINTNET and PPP.I tried using
Connect and get a message about invalid logon.(I made sure I entered
My UserId and Password correctly).When I use Sting I have no problem
connecting (and when I tried going through Compuserve using PPPKIT I
had no trouble.)

I'm guessing because Sting uses PAP I should try to set up PPPKIT to
make a PAP connection.

Can someone show me how I go about setting up a PAP connection using
PPPkit?
Thank You
Mike

1. Create a file /etc/ppp/pap-secrets. This should contain the usernames
and passwords for all your PAP-accounts, one account on each line:

username * password

2. chmod 600 /etc/ppp/pap-secrets
If you don't have /etc on a minix- or ext2-filesystem you can't do this...

3. Add a 'user username' in the options-file (replace 'username' with your
PAP-username).

4. ...and make sure that your login-script is correct. You usually don't
need anything after CONNECT when you're using PAP or CHAP.

>You've forgotten to say what the problem was?
Sorry!
    The procedure (it's supposed to be an include-file) is meant to control whether the input from the user is in integer format and force him to reenter his input if it's not.
    The program itself only tests the procedure in that it returns whatever input the user has given with "****" in front. The procedure is there to only let through variables of the sort integer.
    Whenever I run this little program, I can input one number. Second time around, I get a RAM violation and a strange error-code, the program crashes and won't let me try again.
    There is a list of incompatible instructions at the end of the PP manual, but I haven't found anything in there.
    Is it the "reset(cf)"? I find that reset seems to mean very different things in TP and PP.
    Hope I haven't forgotten any CR/LFs

On mu TOS 3.01 TT none of these problems show up! Both gemdos and xbios
time can be correctly set and read up to 2107!

Only when letting the computer roll over from 28/2-2100 to 1/3-2100
there was a small glitch. Right afterwards gemdos gave 29/2 but xbios
gave the correct 1/3. After opening and closing the Control panel they
were both on 1/3. Interesting. Actually it looks like someone has put
in the 400 year rule into TOS!. Year 2100 is not a leap year according
to this rule. I guess some of the TOS programmers hoped for TOS beeing
in use up to the 2200 century.

The keyboard processor clock is a totally different story, though.
Maybe they hoped for a newer TOS add on that you can talk with :-) If
so it really should be out by now.

>The good news is that the GEMDOS Trap #2 - Date and Time functions

True!

>The bad news is that a lot of programs use the XBIOS functions and
those
>programs that do so will need a patch.

Not true here!

I did these tests with a small GFA program to be able ta set any year.

> Hope I haven't forgotten any CR/LFs

Here's two extracts from my Prospero Pascal manual - it was pretty conforming back then. The info may be useful...

<start>
8.3.1.2 reset and rewrite

The procedure reset(gf) prepares gf for input. If the file is empty, eof(gf) becomes true, otherwise eof(gf) becomes false and the buffer variable gf^ is positioned to the first element of the file.

The procedure rewrite(gf) prepares gf for output. The buffer variable gf^ is positioned to the first element, and eof(gf) becomes true. Any previous contents of the file are lost.

In general, any file must be initialised before input or output operations can be performed. Exceptions are the standard files, "input" and "output" for which initialising is done before the Pascal program is entered.

8.4.2.1.5
PROCEDURE reset(VAR f:FILE)
PROCEDURE rewrite(VAR f:FILE)

These procedures are part of Standard Pascal, and have already been defined in section 8.3.1 in relation to workfiles. They are also applicable when an external filename has been assigned and the file is to be processed sequentially. "Reset" prepares the file variable for input (read) and "Rewrite" for output (write) operations. Calling reset or rewrite causes the operating system "open file" process to take place.

Example:

```
assign(f,'B:SUBDIR\NAME.EXT');
rewrite(f);
writeln(f,'First line of text');
```

When reset is called the external file must exist (but may be empty, in which case eof(f) is immediately true). If reset is called with a parameter which is an already-open file, it is repositioned at its first element. When rewrite is called, if the external file already exists its contents are deleted, and if it does not a new empty file is created.
</start>

Possible concerns imo would be that "settextbuf" and how "reset" acts upon it. Perhaps the file variable cf has remained at "eof" after the first input - if so, it might just be the case that a second input attempt is shoving text in "past eof" (ie leaking into memory after 'puff'), thereby crashing your program.

Maybe "reset" out to be within your repeat/until loop?

I think it's because you have defined "n" as a word (2 bytes) and
then told the procedure to read it (anzahl) as a single byte, which
would be the first of the two-byte binary number, ie: zero every
time. Try defining n as byte as well?
Gary.

I'd like to know if there is a way to know the name under which one
(that is if I were a program :)...) is executed?

I know Fsfirst can be used if one know the prefix of the name and the
directory to search to, but is there is another way that also works when
the program is launched from within another (unknown) directory?

Please do not tell me to use a particular startup lib, I would precisely
like to know how it works...

Thanks by advance,
G.D.

P.S.: I want to join the Copy/Paste slayers' club!
How does one submit Henke ;) ?

argv[0] traditionally is reserved for the program name. Unfortunately
the format of said program name can & does vary. It might be the
entire path plus executable name, it might be the executable name or
it might only consist of the "stem" - executable name minus executable
extender (ie .PRG or similar removed).

Just to make life simple (not!), a bog standard Atari won't get
anything from Gem: argv[0] is empty. Thus, the only time you'll get
something is if another program passed the name, such as a command
shell.

>I know Fsfirst can be used if one know the prefix of the name and the
>directory to search to, but is there is another way that also works when
>the program is launched from within another (unknown) directory?

You know what kind of program you are. This may make the situation
less vague as it may narrow down the environment. However, this kind
of approach can help...

Look at argv[0]

Full path? fine.

Exename only? Interrogate system for exe's folder - "dos" is almost
always the current working directory (cwd) so
FsFirst/Next(".\\progname.*") will locate it. Should your program be

capable of running when its folder isn't the cwd then it invariably turns out to be a unix kind of thing where you'll be using an environmental variable - problem can be bypassed via that.

Gem. Although it is possible to start a Gem program with the cwd != the executable things usually go wrong (consider rsrc_load("progname.rsc")). You can enquire of the AES (I forget which call offhand) and see what that comes up with: the older the Gem the less useful this info is. However, due to the fact cwd has to be set to the executable then FsFirst/Next will work here - even under OS's such as MagiC, which maintain multiple cwd's, one per app. Again, should your program be designed to cope with cwd != executable then we're back to the unix situation again.

Nothing in argv[0]? FsFirst(".*.app") - will locate your program's name. You might consider looking for a combination of extenders - I often change them (.PRG -> .GTP for example) iyswim.

>Please do not tell me to use a particular startup lib, I would precisely
>like to know how it works...

Here's the 64,000 dollar question though...

Just how often does a program get written that *really* needs to know its own name? ;-))

Imo, the less a program has to do with the underlying filing system, the better its chances are of working!

Hi Guillaume!

GD>I'd like to know if there is a way to know the name under which
GD>one (that is if I were a program :)...) is executed?
There's only one way that work's reliably:
Fcntl(PLOADINFO);
See MiNT doc for more information

Bye

Joerg

also you may want to check out
http://www.cix.co.uk/~derryck/

here is the text that Derryck includes:
"MagicSLM (German docs) A software solution to the problem of printing
from a Falcon/PC/Mac or whatever to Atari's SLM804/605 laser printers
using an HP Deskjet or Laserjet 300dpi driver on the client computer.
You will need the ST (minimum 2Mb memory), the Diablo emulator
(available on ftp sites), and a null modem cable to connect the two. Use
the highest common baud rate, 8-N-1 with no handshake on the ST, same
settings but XOn/XOff on the client computer, or if you can't redirect
printer output to the printer port you may be able to print to a disk
file and take that to the ST (full package).

Hi everybody,

I tried posting a message similar to this one in the general atari st forum, and I am hoping to find some more people in this forum with the same problem, or better yet with the solution :))

Where do you find GNU C/C++ distribution that works reliably enough and that has all the necessary libraries/includes not just some?

I am trying to install one version of GCC that would work reliably enough, and didn't have much luck so far. Sometimes it's the libraries or includes, sometimes binaries... It also seems there's no one individual FTP site where you can download the full distribution from, but it's all bits and pieces that you have to collect from many different places. If nothing else, I wish somebody would post some installation notes on how to get a complete and reliable version of GCC.

Here are some annoying bugs that I found in the available releases:

If you have 2.8.1c or 2.7.3 try this and you'll confuse the pre-processor:

```
#include <stdio.h>
#include "whatever.h"
/* use some things (typedefs, prototypes...) from whatever.h */
```

If you put #include <stdio.h> in "whatever.h" it will be ok. What's even funnier, if you put the second line before the first one, it will work (provided you don't use anything from stdio.h in whatever.h)

Another #include bug:

for example, make these files:

```
./main.c
./include/main.h
./include/structs/struct1.h
```

1. from main.c #include "include/main.h"
2. from main.h #include "structs/struct1.h"

Step 2 won't work... :(((

One of the worst bugs for me, when using the getc() function from <stdio.h>, the compiler complains about its defintion!!! I think what we have is an obsolete version of <stdio.h> header.

If somebody knows something more about any of these problems, please let me know, I'd appreciate it. I am hoping it's just me, otherwise it would be relly sad us atarians are left with only one dev. environement, that's not even reliable enough to work with.

Regards,

Nenad

m > What is an alternate way to do a "movep"?

If it's only two bytes you could

```
    LSL.L #8,D0
    LSR.W #8,D0
    MOVE.L D0,<ea> ;odd bytes
```

or

```
    ROR.L #8,D0
    LSL.W #8,D0
    MOVE.L D0,<ea> ;even bytes
```

but frankly, movep is better.

I think I got it from the latest 'Whiteline' CD. In addition there was
an article in the german STC where IIRC something stood about renaming
some library files. I think after that 2.8.1 worked fine for me.
Since I destroyed my minix partition a few days ago I will have to
install everything again in the near future. So if your problems are
not solved until then, I can tell you step by step what I did,
afterwards.

The only thing I use GCC for is compiling the Atari800 emulator source
but I never had any problems with 'include' there, neither with 2.7,
nor with 2.8. The only problem I had (and never were able to solve)
was that I couldn't find any way to use 'make' and had to write seperate
commands for every module to be compiled.

Gerhard

The original reason for Motorola to make this instruction is
"This instruction is intended to simplify data transfers between the
processor and 8-bit devices"
So we can do without it. But it gets more complicated to do.
No only have you to take care of odd/even in source and target
aderssses but also do it different when the MoveP does long or word
operation size! And also remember:
"As each byte of data is transferred (long word operand), the adres
is incremented by 2. Note that the contents of the address register
itself are not incremented."

You could try these as an alternative. All of the subroutines use d0 as the data register and a0 as the address register. A0 is preserved in all of these subroutines.

```
; movep.w register -> memory/peripheral
moverp_w        link    #0,a6
        move.l  a0,(a6)
        ror     #8,d0
        move.b  d0,(a0)
        addq.l  #2,a0
        ror     #8,d0
        move.b  d0,(a0)
        move.l  (a6),a0
        unlk    a6
        rts

; movep.l register -> memory/peripheral
moverp_l        link    #0,a6
        move.l  a0,(a6)
        ror.l   #8,d0
        move.b  d0,(a0)
        addq.l  #2,a0
        ror.l   #8,d0
        move.b  d0,(a0)
        addq.l  #2,a0
        ror.l   #8,d0
        move.b  d0,(a0)
        addq.l  #2,a0
        ror.l   #8,d0
        move.b  d0,(a0)
        move.l  (a6),a0
        unlk    a6
        rts

; movep.w memory/peripheral -> register
movepr_w        link    #0,a6
        move.l  a0,(a6)
        move.b  (a0),d0
        ror     #8,d0
        addq.l  #2,a0
        move.b  (a0),d0
```

```
        ror     #8,d0
        move.l  (a6),a0
        unlk    a6
        rts

; movep.l memory/peripheral -> register
movepr_l        link    #0,a6
        move.l  a0,(a6)
        move.b  (a0),d0
        ror.l   #8,d0
        addq.l  #2,a0
        move.b  (a0),d0
        ror.l   #8,d0
        addq.l  #2,a0
        move.b  (a0),d0
        ror.l   #8,d0
        addq.l  #2,a0
        move.b  (a0),d0
        ror.l   #8,d0
        move.l  (a6),a0
        unlk    a6
        rts
```

Not very efficient, and they take up some space, but they should work as good as the real movep.

> environement, that's not even reliable enough to work with.

When you write a header file you must take steps so that multiple includes of the header file
does not cause problems, as the header file is only required to be parsed once during the
compilation process.
For example if i wish to create the header file ingtcp.h I would use the following construction:-

```
#ifndef _INGTCP_H
#define _INGTCP_H
/* the above two lines ensure that the first time the header is parsed the definitions
will be stored for use by the compiler, but is ignored if parsed subsequently */

/*- Global constants and other stuff in the file
--------------------------------*/
#pragma ident   "@(#)$Id: ingtcp.h,v 1.5 2000/01/14 10:45:44 dba Exp $"

#include <stdio.h>

#define ING_OK  0       /* All subroutines return this value if OK */
#define BAD     -1
#define YES     1
#define NO      0

#endif  /* _INGTCP_H HEADER INCLUDED */
/*---above line is the last in the file ingtcp.h and matches the #ifndef _INGTCP_H ---*/
```

examine the stdio.h file and you should see the above construction in the file

regards

Yup, now the GEM++ library is the problem :)

It compiles pretty well, but the linking is the problem again. I have tried to compile on my own a small example called ACCes, that I found on this page:
http://www.qnx.com/~chrish/Atari/GEM/index.html

When I try to link the modules of this program I get many "Undefined symbol ... " messages. Here's what they say:

```
Undefined symbol GEMformwindow::GEMform virtual table referenced from
text
Undefined symbol _InFocus__13GEMformwindowb referenced from text
Undefined symbol GEMformwindow::~GEMformwindow() referenced from text
Undefined symbol ___ti13GEMformwindow referenced from text
Undefined symbol ___tf7GEMmenu referenced from text
Undefined symbol ___ti7GEMmenu referenced from text
gemw.o: Undefined symbol __intin referenced from text

gemw.o: Undefined symbol __intin referenced from text
gemw.o: Undefined symbol ___aes__ referenced from text
gemw.o: Undefined symbol __intout referenced from text
gemw.o: Undefined symbol __intout referenced from text
```

Does anybody know what I might be doing wrong (again) :)

Cheers,

Nenad

>Fair enough, but seriously, what does that achieve??.
 C'mon tell us. I've become curious as well now.
I figure you probably forgot you did have something on the clipboard and then overwrote it with a second "copy"?
OTOH you should push the abolishment of the 'cut' feature. Because then it's really lost!

I've been playing around with TOS 4.04 and noticed that images loaded into Hex Edit,TT Digger and BSS Debug sometimes don't quite jive with one another. I trust BSS Debug as the image files look like what I see in memory. Desert Drain seems cool, but V1.57 is really buggy on my Falcon, not being able to download the whole ROM area in memory and the editor doesn't pop up into a window, just a white screen. V1.52 works fair. Would be nice if TT Digger could save a binary file like

Hex Edit, otherwise, that app is a lot of fun.
Peace Debug is a bit over my head, and like using BSS Debug, but it doesn't use GEM, so I have to disable my NOVA. Egad I forgot what 640*480 looked like:).
What is the best way to get a copy of the image? How do I read the first 8 bytes of ROM into a file? Manual says I have to be in Super mode. What is the beginning address to burn code into 2 ROMs for the cartridge port?

TIA,
Mike

To answer one of my own questions, there is no offset (at least with the diagnostic ROM booting from TOS ROM) necessary. The cartridge I have doesn't work with 27C256 ROMs (32K) so you need either the 512's (64K), 1024's (128K). Found a 44 PLCC to DIP adapter in Digikey for $24.00 to adapt the Falcon TOS ROM to the available EPROM burner here.
Following the TOS ROM at boot up is a chore, but I guess I am not the only one who has ever done this:) If you really want to know about your hardware, but just didn't get it the first time reading documentation, get a debugger and follow step by step with manual in hand. This is all new to me, and it sure opens your eyes up to what is going on when you click an application, or turn on the juice.
There is a guy with a bus analizer sitting outside the door tied into an SGI, and I have been looking over his sholder. Sure looks like it makes the job much easier.

I am trying to get magic (v5... I think) to allow me to use LatticeC (v5.6). Now, I can *use* LatticeC, even compile, but if I made any mistakes, causing lattice to tell me I'm getting compilation errors, magic gets really upset and crashes catastrophically ("system halted").

Anybody else have similar problems with crossing magic and lattice? I haven't bothered to try LC.ttp to compile without using the menu-set

options (not sure how to do that, anyway), but I do know that it has nothing to do with any accessories I use. Must I go back to swapping between everest and latticeC under TOS, put up with the lattice editor, or is magic6 any nicer?

... every day a new instrument and a new method is invented.

I am clearing out. I have lots of games for Atari,Amstrad cpc464,atari ST, Commodore 64

Atari 800xl for sale, this computer comes with some games and sotware, inc assembler editor cartridge. there several Atari manuals including operating system source listing,Atari hardware manual, operating system manual, operating system users manual, sio users guide and more. There two 1050 disk drives and a 1010 cassette drive and the power supplies.
2ST's for sale and a Mega2, 270meg hard drive magic cad fastweb connection 4meg memory vidi st etc

CPC 464 computer comes with color monitor, two Amstrad disc drives and a DMP1 printer. A box full of games and cpm. Mini Office. The four main Amstrad manuals, operating sys firmware specification, Devpac manual, Concise basic specification and DDI-1 firmware, complete cpc464 disc operating system rom specification. A few books on the 8 bit Amstrad. Protext and Wordstar. several Amstrad action magazines

It seems I am still out from nodelist, Peter can you check my connected areas
?

BTW the question is this: Applylst does not work as it seems to be affected
by the y2k bug, so it deletes my nodediffs as it recognizes them as "obsolete
difference file".

It it possible to get the Applylst sources or is there another software that
can do this ? Breakneck ?

Hi :)

I would like to create an international newsgroup (english language) bas
ed
only around discussions and thoughts about our Operating System evolutio
n.
The purpose is to establish some specifications about new calls,
AES object structures or other. Any thoughts about functions, interface

possibility, function implementation will be welcome in this future
newsgroup. To participate in this newsgroup, no need to be a programer.
.
Just by telling what you would like to see on your Atari, or what you li
ke
about other OS will be considered helpful. I want to create this newsgro
up
about Atari OS because I think that no specific goal, no near future
vision is what stops our OS to move forward. If you wish to see such a
newsgroup, email me, I will take care of everything to implement it.

Lehmann Gaetan

Hello

I'm doing a GEM Shell for GCC (2.8.1), but I have a big problem under
normal TOS (Magic and Mint Ok)
when I launch GCC.TTP with Pexec all looks Ok, this program launch
himself CPP.TTP the preprocessor.
This program work for a time and compilation failed, he looks not find
its Include Directory (I think). All parameters
are Ok, does someone have an idea?

Thanks
Olivier

I Have been offered £60 for all this is there any more interest

Atari 800xl for sale, this computer comes with some games and sotware, inc
assembler editor cartridge. there several Atari manuals including operating
system source listing,Atari hardware manual, operating system manual,
operating system users manual, sio users guide and more. There two 1050
disk drives and a 1010 cassette drive and the power supplies.
There is a photocopy of "de re atari"

Hi all,

Got a problem with BubbleGEM I just cannot sort out. Under MagiC it
seems like the BubbleGEM helptext will sometimes show up in the title of
any of the opened windows belonging to my program.

I believe I both have reserved memory for both the window title text and
for the bubbleGEM message text. What could be wrong here??

Please help!

Regards,

Joakim

I would happily pay £30-40 for a working disk drive, power pack and
leads and dos, on its own.
Have at look at www.e-bay.co.uk and serch atari. That should give you an

idea.

If you are using gfa-basic and I'm assuming you are, you
have to be very careful how you allocate such buffers.
Some types of variables, like strings get shifted around
in memory and if you use strings as buffer, strange errors
can appear.

Yes, I am using GFA. :) (what else?) ;)
Well I am using some sources from Ictari for handling the
BubbleGEM-stuff

Bubblebuffer is used like this;

```
 bubblebuf%=MALLOC(256)
 CHAR{bubblebuf%}=LEFT$(bubbletext$,255)
```

Memory for window title and info bar is reserved like this:

```
adr_title%(window_number&)=MALLOC(128)
adr_info%(window_number&)=MALLOC(128)
```

Is there a problem somehow with this code?

Another thing, how would a compiled program react if not enough memory
was reserved via $M ? Crash? Funny stuff like above mentioned? How will
I know exactly how much memory to reserve with $M above filesize?

Thanks,

Joakim

Hi,

I am helping a friend port his program to Atari. The problem is about transfering the memory that stores the 24-bit data to the screen. The format we need to use is 3 bytes for each pixel (RGB), one pixel after another. It seems that VDI (MFDB) doesn't support the graphics organized in this manner. Is there a way around this - without reorganizing the bits. Any help is greatly appreciated.

Thanks,

Nenad

Hi all,

Discovered a strange thing when testing a program I am working on;

When topping any window (after having another top app, then my prog) by
clicking on the windows title bar everything seems normal. Menu changes
to my program and works ok.

Ok, but if I click inside the work area of my window then I will get
strange results even though it is handled exactly the same way
internally. MagiC will now change to my programs menu, but the earlier
apps entries will be the one that shows if I go up and try to access it.
And it will not work until I select a new top app.

What am I doing wrong here? Hope it is nothing really, really stupid...
;)

Regards,

Joakim

There's no converting routine in the VDI, no. You will have to do that
yourself, or perhaps if there is some lib that I don't know of.

Tomas

As far as I know numeric arrays don't move. I never use ERASE
just to be safe. It looks ok to me what you have listed.

> Another thing, how would a compiled program react if not enough memory
> was reserved via $M ? Crash? Funny stuff like above mentioned? How will
> I know exactly how much memory to reserve with $M above filesize?

I think they halt with an ERROR 8.
That is a good question, and it seems to be best guess. All I can tell
you is to add up all your arrays, all your strings and such to get
a value, and then add some to that for a safe zone, just in case.
How much extra to add is the guess work part. Sorry I don't have
better answer here.

The physical memory in the 24-bit card may be stored several ways
so unless you know the format for a given card, it may be a problem.

The only other thing I can think of would be to convert the
image to vdi device independant format and have the VDI on the
machine transform the image for you to device specific.

I am not sure whether this helps, but I had problems with bubble help
coming up as soon as I moved the mouse over the relevant field, or
left-clicking (rather than right, which should bring up the bubbles). I
solved this by making sure that Thomas Much's BUBGEM_E.CPX was active
and set to 2000 ms for open. Just my 2 cents worth....

Regards, /Peter/

Ok, so it seems safe to assume that as long as the program do not halt
due to ERROR 8, it really has enough memory to play with. I will go with
that.

Thanks for all help! :)

It should be totally independent of the hardware.

> The only other thing I can think of would be to convert the
> image to vdi device independant format and have the VDI on the
> machine transform the image for you to device specific.

That's exactly what I am trying to avoid. This would mean that I would have to write special routines for converting my memory to bit-planes one, which is out of the question (cross-platform issues).

However, look everyone what I found in NVDI 5 documentation (you can download it from www.nvdi.de). It seems that NVDI 5 modernized this situation and it really answers my question. This is the new function:

```
vr_transfer_bits( int16 handle,
GCBITMAP *src_bm,
GCBITMAP *dst_bm,
RECT16 *src_rect,
RECT16 *dst_rect,
int16 mode );
```

and this is the GCBITMAP structure which looks like a modernized version of MFDB (there's no mention of Atari's old-fashioned bit-planes):

```
typedef struct _gcbitmap   /* Öffentliche Bitmapbeschreibung (Struktur
mit Versionsheader) */
{
   int32       magic;      /* Strukturkennung 'cbtm' */
   int32       length;     /* Strukturlänge */
   int32       format;     /* Strukturformat (0) */
   int32       reserved;   /* reserviert (0) */

   uint8       *addr;      /* Adresse der Bitmap */
   int32       width;      /* Breite einer Zeile in Bytes */
   int32       bits;       /* Bittiefe */
   uint32      px_format;  /* Pixelformat */

   int32       xmin;       /* minimale diskrete x-Koordinate der Bitmap
*/
   int32       ymin;       /* minimale diskrete y-Koordinate der Bitmap
```

```
*/
   int32       xmax;       /* maximale diskrete x-Koordinate der Bitmap
+ 1 */
   int32       ymax;       /* maximale diskrete y-Koordinate der Bitmap
+ 1 */

   CTAB_REF    ctab;       /* Verweis auf die Farbtabelle oder 0L */
   ITAB_REF    itab;       /* Verweis auf die inverse Farbtabelle oder
0L */
   int32       reserved0;  /* reserviert (mu? auf 0 gesetzt werden) */
   int32       reserved1;  /* reserviert (mu? auf 0 gesetzt werden) */
} GCBITMAP;
```

Unfortunately, you have to have a copy of NVDI 5 installed on your
computer, and one even worse thing: the library of the new functions
(these don't exist on the standard VDI) have not been ported to GNU C!

It is, that is what I was trying to say. Every card can have a different storage method, and the VDI loaded on the machine knows how to deal with it, so it's effectively transparent to the programmer.
So if you call vr_trnfm() the VDI handles the transformation for you regardless.

vr_trnfm() is always available as well.

Outside of this method you would have to have dev info for every card and know the memory format and code custom routines, then when some new card comes out, your code will probably break.
Not to mention detecting all known cards.

The way I see it you only have to convert it to one format, and then
let the VDI on the target machine transform it. But then on the
other hand I don't really know what specificly you are trying to do.

Yup, that is a problem if you intend to make a program useable by all
Atari users. If you find a way to do this, let us all know. ;-)

Bonjour :)

I'm implementing (or trying to) GEMScript in Joe. Studying the
German developper documentation,

1) I would like to know if the commands are case-sensitive like in
common scripts or C language.

for example, read in the doku: Save
and in FreeBase doku : save

2) Moreover, how the GS_ACK with string answer and successful call
differs from GS_ACK with message failure, I didn't manage to uncipher
this part.

3) Where can I find the interpretor for .SIC files? There's the
Scripter from ASH, but I (wronly?) think it's a commercial and
expensive product. Is there another free?

4) During the execution of the script, is the controlled application
responsive for others events (such as user keypress or mouse click)?
What must be the application's behavior?

Thanks for answering

bye

Rajah Lone

No, they are *not*, use stricmp().

> how the GS_ACK with string answer and successful call
> differs from GS_ACK with message failure

You can only know by msg[7]. GSACK_OK is success, every other value is failure. Even if GS_COMMAND fails, GS_ACK can return the reason for failure as an ASCIIZZ text in msg[5/6].

If an application receives GS_ACK with msg[5/6] != NULL (regardless of success or failure), the application has to send GS_ACK back to the original sender of GS_ACK (see GEMScript hyper text, section "GS_ACK").

> Where can I find the interpretor for .SIC files? There's the

You're looking for Mark Wherry's SimpleScript:

  http://www.cix.co.uk/~mark_wherry/sscript/

> During the execution of the script, is the controlled application
> responsive for others events (such as user keypress or mouse click)?
> What must be the application's behavior?

If you want your application to be locked during execution, implement calls like lock/unlock which must be called explicitly by the script.

BTW: My GEMScript home page is online again:

  http://www.snailshell.de/GEMScript/

bye, Thomas

Fine, but the next one will occure, if your program is running under memory protection. ;-) The BubbleGEM buffer must be allocateted global! You should better use someting like this:

```
' Call this function once somewhere in your startup code:
mxmask%=@mxmask
' ...
'
FUNCTION mxmask
  $F%
  IF GEMDOS(68,L:-1,0)=-32
    RETURN 0
  ELSE IF GEMDOS(290,-1)=-32
    RETURN 3
  ELSE
    RETURN -1
  ENDIF
ENDFUNC
'
' Call this function if you need memory which will be used by other
' applications (AV-protocol, BubbleGEM ...)
' ...
bubblebuf%=mxalloc_global(256)
'
FUNCTION mxalloc_global(amount%)
  $F%
  IF mxmask%<>0
    RETURN GEMDOS(68,L:amount%,&X100011 AND mxmask%)
  ELSE
    RETURN MALLOC(amount%)
  ENDIF
ENDFUNC
```

I downloaded screen.ldg and the main library. I am having some problems
with getting the so-called example provided with the main kit to work.
The ldg_exec(ldg, "screen.ldg") call fails for some reason. I think I
set everything up properly:
- LDG manager is loaded
- LDGPATH, LDG_GARBAGE, LDG_IDLE enviromental variables are set
The whole documentation is in French, so there might be something I am
doing wrong.

Do you have some basic examples for GNU C - unfortunately there is
almost no examples provided with the dev. kit. I really think it could
work.

Thanks,

Nenad

Sorry, I should have probably used singular ("a routine") - but still,
this conversion to planes, does present a problem.

> > Unfortunately, you have to have a copy of NVDI 5 installed on your

Hm, yes. Well, I wouldn't mind this requirement for NVDI 5, it's just
that they didn't think it would be necessary to support GNU C as well.

Cheers,

Nenad

Hi!

In article <8a5gbidsu1@nnrp1.deja.com>,
     Joakim H⊗gberg <gokmase@my-deja.com> writes:
> I was not aware that there might be problems with MALLOC under memprot.

There isn't, but there's a problem on TT and Falcon TOS: Both crash or exhibit other strange behaviour when Mxalloc() is called with memory protection flags. Thus, the code Ulli provided ensures that the memory protection flags are masked off before a call to Mxalloc() is being made when there's no memory protection.

Note that the code doesn't atually test for memory protection, but for the existance of the Sysconf()-call. This is a GEMDOS call present in all versions of MiNT supporting memory protection, but not in TOS or MagiC. Andreas Kromke agreed that - if he implemented memory protection - MagiC would get this call, too.

Ciao

Thomas

The new URL (with screen.ldg version 1.01) is
http://olivier.landemarre.free.fr

>I downloaded screen.ldg and the main library. I am having some problems
>with getting the so-called example provided with the main kit to work.
>The ldg_exec(ldg, "screen.ldg") call fails for some reason. I think I
     ^^^^^^^^^^^^^^^^^^^^^^^^^^^^

the right call is:

```
 LDG * screen_ldg;
 screen_ldg = ldg_exec(app_id, "screen.ldg");
```

where app_id is the app_id of your application.

Hehe, strange way to get sourcecodes but I'll check that.

Hi!
I have a problem with the atari-port of gcc. The compiler runs
correctly, if my code is not preprocessed (I get only a message of
unknown # commands, but that is ok). But if I try to compile
preprocessed code, I get the nasty atari-bombs (the compiler chrashes).
I tried also g++ with the same effect.

Thanks,
Matze

Greetings all,

There are now 3 completely new archives, and 2 of the old ones are
updated with more icons. Check out the nice 48x48 icons in archive 37
and also the animated cartoons in archive 39.

Stay tuned for more! ;)

But DO NOT stop reading now! I would very much like inputs from atari
users all over. What do you think about the icon library? Give me some
feedback, so I can keep imnproving the site. Thanks! :)

Now you can go see the icons: http://gokmase.atari.org

Regards,

Joakim

heja guys from plush...

mann, mann... some c64 guys who dont know THE c64-source???

take a look or search for "the fridge" and get all c=hacking
ascii-issues... there are all infos you need... i can not remember the
url...

f.e. the really fastes mul-trick...

;=)

papa, heaven

ps. ich habe die c64-sources here auf meiner festplatte...

There's a longer URL, but if you just remember www.ffd2.com (and how could
you forget?) you'll be in good shape.

Happy Christmas all,

It was this time 3 years ago that i got my first programming language, DEVPAC 3. The hours of sleep ive lost playing with that, looking at the clock, noticing its 3
o'clock and thinking i'd better get 3 hours kip in for work that morning..

Happy new year.

Regards from STEve & his nice warm cosey PAK'd MegaSTE .

Thats good news about my mailer, but not so good about traffic in here, i like a good
lurk in this base to see what i can learn. Any idea why its so quiet??

The MagiC cookie is "MagX" - unfortunately I can't recall the MiNT
(probably exactly that) one, but someone else will know for sure.

Here's a integer square root algorithm for the MC68K. Shouldn't be too hard to port it to the 6502, I'd say. In case something's not clear about it, feel free to ask.

```
;****************************************
;** SqrtInt: Fast Algorithm for calc.**
;** the square root              **
;** here for 32 bit integers         **
;****************************************
Start:                      ;this is for testing purposes only
        move.l #$f4237842,d0
        bsr SqrtInt
        move.l #$734b8229,d0
        bsr SqrtInt
        move.l #$14ac9,d0
        bsr SqrtInt
        rts
SqrtInt:
        saveregs d2-d5

        moveq #0,d2             ;Q=0 -> kept as W
        moveq #0,d3             ;Z=0 -> new approximant
        moveq #1,d4             ;W=0 -> final root (almost)

        for.l #16,d1
         lsl.l #2,d2
         add.l d4,d4
         subq.l #1,d4

         add.l d0,d0             ;I to the left
```

```
         roxl.l #1,d3            ;shift carry into Z
         add.l d0,d0
         roxl.l #1,d3

         move.l d2,d5
         add.l d4,d5
         cmp.l d3,d5
         bhi.s .nothing
         addq.l #2,d4
         move.l d5,d2
.nothing:
        next d1

        subq.l #1,d4
        move.l d4,d0
        lsr.l #1,d0
        loadregs
        rts
```

Registers d0 to d7 are data registers and hold 32 bits of integer.
"for" is a loop, here for 16 iterations (the number of bits in the result).
"move" moves the left operand to the right one. "lsr" is "logical shift right", shifts the LSB into the carry, but does not shift in the carry into the number, but a zero. "lsl" shifts leftwards, the amount given in implicit addressing. Again, the MSB goes into the carry, the LSB will be blanked.

"cmp" compares two operands, the right one with the left one, sets carry accordingly (and just the other way round compared to the strange 6502 carry logic). "bhi" means "branch if higher than". "add" and "addq" are addition commands, adds the left operand to the right one, NOT including the carry, but setting the carry. "roxl" shifts leftwards, thru the carry like the 6502 rol does, except that it is 32 bit. "subq" and "sub" subtract the left operand from the right one, again ignoring the carry, but setting it.

Nice exercise to think about how this algorithm works. I leave this as an exercise to the reader. ((-;

Greetings, Happy New Year,

Thomas

Nope, I have no idea.. could be that the few programmers left know their
machine by now :) Its too bad that the traffic is so slow anyway. But I'm
sure if you ask, you'll get answers :)

regards,

Odd Skancke - ozk@atari.org

Greetings,

I am looking for emulation packages that run on W98/NT4. In particular, I am looking into running it on a W98 laptop.

GEM2000 by Emulators, Inc. seems to require either a hardware extension with the TOS ROM's plugged in, or the TOS images on disk. For laptops, they recommend the disk image.

Are there any TOS utilities to extract the TOS image from the ROM? I don't know which version it will be, we have several different ones we may have to try.

What are the image requirements (Lo, Hi, headers etc?) I may be able to write such program (I forgot if the ST let you access the ROM contents without giving you an access exception - and I also don't know what address the ROM started and where it ended). Information would be very appreciated.

If you were looking for an archive, which ftp site would you look at these days?

Help is greatly appreciated.

Best Regards,

Mustafa Soysal

Anybody ever managed to assemble an executable of 1.4Mb using Genst 3?

The file is ok upto 1.1 Mb and Genst assembles really quickly at the size. When the size gets bigger the resultant file screws up and Genst takes about 2 minutes to assemble.

I have tried all sorts to sort it out but it still won't assemble my code. I don't want to recode my demo just 'cos of a feature.

Mark

I've just been reading my way through an Emulator FAQ at http://members.aol.com/rg1004/atstemu.faq.html which gives some ideas, and URLs (which I haven't had time to try yet).

I'm looking for the same thing..an ST emulator I can use on an old 486DX to develop software for an ST520 that I've just bought.

Does anyone know of a good free programming environment (Basic or Pascal prefered) for the ST?

Thanks

Paul Cull

Actually, some of the links in that FAQ are old. The Little Green Desktop at
http://www.pacifist.fatal-design.com/ is probably the best place to start an
emulator pilgramage, IMHO.

Hi,

I am trying to call BubbleGEM from within a program of mine but have experienced problems under MagiC, but under Geneva it seems to work OK. Under MagiC it seems like it only works a couple of times, and then no program is able to call the bubbles.

This is what I did: (after checking that "BUBBLE " really is started)

1) Wait for request (time-triggered) from BubbleGEM
2) Recieve memory and send BUBBLE_VIEW back to BubbleGEM
3) Wait for BubbleGEM to send BUBBLE_ACK (saying "bubble is closed")
4) Release memory

What am I possibly doing wrong here? Have I misunderstood something here?

Thanks in advance,

Joakim

I don't know if GNU has Pascal, but their gcc was pretty good for command
line programs.

I have not tried to use BubbleGEM myself, but have you looked at the
ICTARI issue that had an article and such on it? Might help?
Hope you get it sorted.

Hm!, can you assemble it in modules and link them all together.

Doesnt GENST use a hard disk partition for compiling, have you got paths
set right, you might be running out of memory and having no swap space is
killing things.

I started receiving mail from people using Outlook, which encodes
messages in UTF8 (i.e. Unicode 8) character-set nowadays.

Can Pine for MiNT or anything else on Atari convert UTF8 to
something we can manage?

>I never wrote a so big ASM program. How do you know how big the executable
is.
>? I suppose you are recompiling a disassembled program, right ?

Genst makes the executable (assemble to disk) and it is 1.4Mb in size.
I cannot assemble to memory as Genst has a limit of 999K.

>Hm!, can you assemble it in modules and link them all together.
 I could but the overall size would still be 1.4Mb.
The problem is I am incbin'ing about 1 meg of MODs.

>Doesnt GENST use a hard disk partition for compiling, have you got paths
>set right, you might be running out of memory and having no swap space is
>killing things.
I just checked and I have 6 meg spare on my drive after Genst has created
the exe.

More news...

When the exe file is 1.2Mb it runs ok, when it is 1.4Mb I get 4 bombs
(illegal instruction).
Because it is running on a Falcon I cannot run AMONST so debug it.

I have tried all sorts of things on this and I believe it is a bug in Genst
that is causing a bad output file.

I am going to try splitting the INCBIN parts to a file and the actual code into another then joining the two.
I may also try the standalone assembler version (TTP file).

I'll let you know.

I have fixed it.

First of all I had used a SECTION DATA and a SECTION BSS but I had not declared the SECTION TEXT.
After I had made the change I got Genst to assemble to 1.2Mb.

When I tried to assemble to 1.4Mb I got a working exe but there were some graphics missing...

By trial and error I figured out the Genst has a limit on the size the DATA segment can be. I increased the TEXT segment which decreased the DATA segment and ... IT WORKED!

I now have a 1.4Mb working exe (PRG) file.

Now all I have to do is get my demo working on RGB as well as VGA.

Any Falcon 030 owners out there who fancy testing a demo for me?

Mark

Actually, only the manual and online help are in German. The programs are
English. There was even a guy (John Kormylo) who created very good help files
in English from scratch.

This was the compiler that was shipped with the original developer kit for the atari, wasn't it. Do you have the kit too?

I had a root-around in the sources for PUG and dug this out...

```
#define  BUBBLEGEM_SHOW    0xbabb

bool
pug_bubblegem(wd,wdi,x,y,s)
PUG  wd[];
int  wdi;
int  x,y;
char s[];
{int msg[8],
     b_apid   =appl_find("BUBBLE  ");

 if (b_apid < 0)   return false;

 msg[0] = BUBBLEGEM_SHOW;
 msg[1] = wd[wdi].wd_apid;
 msg[2] = 0;
 msg[3] = x;
 msg[4] = y;
 msg[5] = (ulong)s >> 16;
```

```
 msg[6] = (uint)s;
 msg[7] = 0;
 appl_write(b_apid,16,msg);

 return true;
}

'wd[wdi].wd_apid'  =your application id
x,y           =bubble position
s             =text (ensure static iirc)
```

...it was one of the last things I added to PUG but iirc there was no need to respond to...

```
#define  BUBBLEGEM_ACK 0xbabc
```

...under MagiC (but I may be wrong).

Hope that is of some help! :-)

Atari shipped the devkits with Digital Research "C" at least that is what is in my kit from Atari. I think also they may have at one

time included Mark Williams "C" or Acylon "C" (<-spelling?).

Hi all,

I am struggling with positioning gem objects correctly under different
AES'. Someone previously mentioned that if FORM_CENTER is used, you can
learn what the real size (including all kind of borders) are.
Unfortunately it seems like if that won't work with N.AES. :(

I thought I might check if the AES if able of viewing 3d-objects, since
I then believe there is a call that can return true size of an object.
Making such a call would certainly crash an older AES version?

Anyone been doing this withing GFA by any chance?

Thanks in advance,

Joakim

You can look at AES version # and determine if certain calls
are available. I think appl_getinfo() can tell you part of
what you want to know. Also objc_sysvar() is the other one you
might need. I wish I had an example how this was done as I've
only ever read about it, and never tried it.

Who has managed to make Trapper 1.4 work on a stock Falcon ? With
Y2K-Patch for example <g>...
Here as soon as I load a program, I get bombs (perhaps related to the
workaround-handler to recatch the AES vector ?).
This is on a CT2-ed 4.02 Falcon

Any help appreciated

Imo there's no really satisfactory way of doing this, especially as
I've a personal dislike of writing code that goes like this...

"if OS=x THEN do A ELSE IF OS=y THEN do B ELSE etc".

The best I came up with relies on centering the object with form_center(). This obtains the clipping area (which may be larger than is needed). This clipping area is then adjusted so that the object can appear at the desired place onscreen.

```
void
Form_Move(x,y,ob)
int  x,y;
OBJECT   *ob;
/*[  void Form_Move(x,y,ob)
     int  x,y;
     OBJECT   *ob;

 Form_Move() performs a similar task to form_center() except that x,y
specify
 the absolute screen position for the tree. ob and cp are changed to
reflect
 the new screen position. form_center() is called to ascertain the
offsets
 required from the object position and the clipping rectangle, after
which the
 object is repositioned. Passing a negative value for x or y results
in it
 being left unchanged after the form_center() call, so passing both as
negative
 is effectively a form_center() call.

 Note that the form is clipped to the desktop workarea.
]*/
{Rect    rr0,
     rr1,
     cr;
 Prect   cp   ={&cr.x,&cr.y,&cr.w,&cr.h};

 /* find the save area */
 form_center(ob,cp);
 if (x >= 0)  {
     *cp.x = x - (ob[0].ob_x - *cp.x);
     ob[0].ob_x = x;
 }
 if (y >= 0)  {
     *cp.y = y - (ob[0].ob_y - *cp.y);
     ob[0].ob_y = y;
 }

 wind_get(WH_DESKTOP,WF_WORKXYWH,&rr0.x,&rr0.y,&rr0.w,&rr0.h);
 rr1.x = *cp.x;
 rr1.y = *cp.y;
 rr1.w = *cp.w;
 rr1.h = *cp.h;
```

```
 rc_intersect(&rr0,&rr1);
 *cp.x = rr1.x;
 *cp.y = rr1.y;
 *cp.w = rr1.w;
 *cp.h = rr1.h;
}

int
rc_intersect(p1, p2)
register GRECT    *p1, *p2;
{
     register int  tx, ty, tw, th;

     tw = min(p2->g_x + p2->g_w, p1->g_x + p1->g_w);
     th = min(p2->g_y + p2->g_h, p1->g_y + p1->g_h);
     tx = max(p2->g_x, p1->g_x);
     ty = max(p2->g_y, p1->g_y);
     p2->g_x = tx;
     p2->g_y = ty;
     p2->g_w = tw - tx;
     p2->g_h = th - ty;
     return( (tw > tx) && (th > ty) );
}

typedef struct grect
{
     int  g_x;
     int  g_y;
     int  g_w;
     int  g_h;
} GRECT;

typedef struct { int x, y, w, h; } Rect;
typedef struct { int *x, *y, *w, *h; } Prect;
```

Btw, sizeof(int)==2 above.

>I thought I might check if the AES if able of viewing 3d-objects, since
>I then believe there is a call that can return true size of an object.
>Making such a call would certainly crash an older AES version?

I struggled with this, spent ages massaging things, only to have it all fall over when I added another feature. It became a nightmare until I stood back and thought about *why* I wanted to know exact sizes. Turns out that if you're prepared to dispense with features that extend outward of the ROOT OBJECT's area ('area' as described in the OBJECT structure) then all difficulties vanish - because you can use the OBJECT area directly. Consider this...

The ROOT object can now be positioned exactly. Restating the obvious: the child objects, being relative to the ROOT, are also positioned exactly. The key to this is the redraw - the AES has to do it and whenever you manipulate a child object don't have the AES objc_draw()

the child, have it redraw the parent of the child. By redrawing the parent you also ensure that features of the child which extend outward from the child will be visually correct.

Imagine you have a ROOT object which has, amongst other things, an I_BOX with three buttons under gawd knows what OS. They might be 2D or 3D visually. Say one of the buttons has OUTLINED status and thus extends outwards of its actual OBJECT dimensions. This may also be the case with the 2D/3D features - we don't know and we don't care! Lets say also, that when you click this OUTLINED button, the OUTLINED status wants removing, and that you want to add a fourth button and adjust the spacing so they are spaced equally...

You use the actual OBJECT areas of the buttons and the actual OBJECT area of the I_BOX to calculate your spacing - nothing difficult there, and now you clear the OUTLINED status of that button. Redraw the I_BOX with objc_draw() to MAX_DEPTH using the I_BOX area as the clipping rectangle. Job done.

The price paid for this technique is you cannot guarantee "visual preciseness". In those (rare) instances where it is important you can always test the OS on startup and load a resource file dedicated to that OS's display habits.

>Anyone been doing this withing GFA by any chance?

Not me I'm afraid.

Not exactly what you wanted but I hope it helps. ;-)

I do think I posted this yesterday, but it seems I forgot ...
What I wanted to ask, is there anyone her still writing proggies with GFA
Basic? I bought me one out of curiosity and started with some books, but
it seems it's all very "dirty", writing directly onto the screen and
using Line-A and so on ...
Is it worth while?
I guess I'd need some help now and then ... anyone knowing any adresses?
My server has no NGs containing "GFA".
CU
Claus

: i'm not sure that TOS will be happy with a 68010 or 020 inside a STF,
: instead of a 68000, because format word are not supported by TOS.
: (I think !)

TOS 2.06 or a patched 1.4. Although the 68010's performance improvement
is near zero.

: A lot of work will be requiered to patch TOS and allow it to understand
: Format word. (And somes others minors things like move from sr, became
: supervisor mode).

The c't did that with 1.4 for the PAK. Which replaces the 000 with a 020.
Ten years ago.
TOS 2.06 works without need for any patches.

Hello,

I'm looking for some information about Midi real-time and system messages :
Active Sensing, clocks, start, stop, song position etc ...

Please e-mail me at
barrilli@club-internet.fr

so that I can directly get it on my Falcon :-)

Vincent

I'm working on a program for MagiC that lets you change your keyboard layout anytime you wish without rebooting.
Now I'm looking for KEYTABLS.SYS files for different languages (e.g. Italian, Swedish, etc.). I already have German, Swiss German, French, English UK and English US. As the file extension is always "SYS" for every language you should also tell me for which language the keyboard layout that you send me is. AND PLEASE: if you send me a file then send also a short reply to the newsgroup to tell the other readers which "language" you sent to me (it would be best to place the language in the subject line), so I won't receive dozens of the same file. Thanx.

I'm still struggling with these, I just can't get it to work as
documented:

- AES: Since MagiC 2 there is the possibility to send messages via
  appl_write() to the SCRENMGR (application #1) to carry out the
  following actions (functions as with the MagiC popup):

```
     Tidy up       (subcode SMC_TIDY_UP)
     Terminate     (subcode SMC_TERMINATE)
     Activate      (subcode SMC_SWITCH)
     Freeze        (subcode SMC_FREEZE)
     Unfreeze      (subcode SMC_UNFREEZE)
     Unhide all     (subcode SMC_UNHIDEALL)
     Hide others    (subcode SMC_HIDEOTHERS)
     Hide          (subcode SMC_HIDEACT)
```

  Binding (->MT_AES.H):

```
--------------------------------------

#define SM_M_SPECIAL     101                            /* MAG!X       */

#define SMC_TIDY_UP         0
/* MagiC 2    */
#define SMC_TERMINATE  1                            /*
MagiC 2  */
#define SMC_SWITCH     2
/* MagiC 2    */
#define SMC_FREEZE     3
/* MagiC 2    */
#define SMC_UNFREEZE   4                            /*
MagiC 2  */
#define SMC_RES5       5
/* MagiC 2    */
#define SMC_UNHIDEALL  6                            /*
MagiC 3.1*/
#define SMC_HIDEOTHERS 7                            /*
```

```
MagiC 3.1*/
#define SMC_HIDEACT         8
/* MagiC 3.1  */

     int msg[8];

     msg[0] = SM_M_SPECIAL;  /* 101 */
     msg[1] = ap_id;    /* ap_id, with SMC_TIDY_UP and SMC_UNHIDEALL own
*/
     msg[2] = 0;        /* No overrun */
     msg[3] = 0;
     msg[4] = 'MA';
     msg[5] = 'GX';
     msg[6] = ..subcode..;
     msg[7] = 0;

     appl_write(msg, 16, 1);     /* apid #1 is the SCRENMGR */
```

Now, I've done all this (apart from the obvious typo in appl_write), but it still doesn't work. Sometimes the wrong application is hidden or displayed, sometimes nothing happens at all and once in a while it does what it's intended to do.

This is very frustrating, I'm sure that there is a way to get this to work as others have done it before.

HP-Penguin is written entirely in GFA Basic and a few other commercial
programs. There are of course tons of Freeware/Shareware programs
written in GFA.

I bought me one out of curiosity and started with some books, but
> it seems it's all very "dirty", writing directly onto the screen and

> Is it worth while?

These books are quite old. But some books feature some good algorithms
which you can use in every program.

> I guess I'd need some help now and then ... anyone knowing any
adresses?

Check out run-software.de - they programmed a visual application
designer for GFA called faceValue. It does most of the GEM stuff for
you.

Greetings,
Matt.

The following code works as expected in one of my programs:

Firstable you have to get the appl-ID of the screen manager. This is done as follows: (you should better not rely on the assumption that the screen manager has always ID 1)

```
     sm_apid = appl_find("SCRENMGR"); // get appl-ID of screen manager
```

Note: msg[7] contains the appl-ID of the target application and not value 0

```
     msg[0] = 101;      // SM_M_SPECIAL
     msg[1] = gl_apid;  // appl-ID of sender
     msg[2] = msg[3] = 0;
     msg[4] = 'MA';
     msg[5] = 'GX';
     msg[6] = 3;        // subcode (in this example: SMC_FREEZE)
     msg[7] = id;       // appl-ID of application that should be freezed
```

Send message:

```
     appl_write(sm_apid, 16, msg);
```

I hope this will help you.

Maybe you can help me about an old question still unresolved:

how do I start an application in "single mode" ?

I tryed different ways unsuccesfully, so maybe I need to scann all
applications, freeze them, launch the one I need "single"..... but how do I
unfreeze all of them when the application exits ?

Or should I send some kind of special call to the desktop application to tell
it to start the app in "single mode" ? I had a look at Thing docs but didn't
find the right info.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

I need, preferably an ST hard drive, or at least an external

floppy.

Until 1993 or so, I used a 1040St with an external floppy and a custom build hard drive. The hard drive died, and then I bought a Pentium.

But I programmed on ST and have a need to update some old software that I created back then.

So, I'm looking for a hard drive for the ST, either an ST hard drive or a custom built one. I'd also need whatever software it would take to get the hard drive working. I doubt that I could find whatever I used back then.

If I can't find a hard drive, I'll consider buying an external floppy. Shortly after my hard drive died, I continued to program using 2 floppies. But now I can't get that old external floppy to work. The light comes on and I can hear a hum, but it won't read any floppies. Might it be reparable, or maybe it just needs a good cleaning?

I've got Gemulator98 installed on my PC but so far I've had no luck in getting my Megamax Laser C to work with, even with the help of the author of Gemulator. The author of Gemulator says he uses Laser C on his PC but for me- it crashes Gemulator. Any advice on this issue?

Even if I can get Laser C working on Gemulator, I'll have another problem- getting my HP4p printer to think it's an ancient HP FX printer. HP sells an FX emulator for the 4p laserjet, but for $200!

Try using:

```
char    *prog="[whatever]";     /* the applications pathname */
char    *attr=" [commandline]"; /* the applications commandline */
/*             ^
```

```
 note the space here. It's a filler to allow the length of the
 commandline to be inserted.
*/
attr[0]=(char)strlen(&attr[1]); /* fill in the length */
status=shel_write(1,0,SHW_SINGLE,prog,attr);
/*
 call shel_write() to execute the application
*/
```

1) Does someone know how a two-side floppy disk is organized in a .ST file?
Is it :
 - track <n>, sector 1, side 0
 - track <n>, sector 1, side 1
...
 - track <n>, sector <NSEC>, side 0
 - track <n>, sector <NSEC>, side 1
or:
 - track <n>, sector 1, side 0
...
 - track <n>, sector <NSEC>, side 0
 - track <n>, sector 1, side 1
...
 - track <n>, sector <NSEC>, side 1
or something other?

2) Is it possible to READ the bit of the YM-register giving the selected side of the floppy drive? It was not clearly stated in docs I have...

Thanks by advance !

Does someone knows what this register is for? It is written to as a word value in my TOS 4.02 (Falcon) ROM.
It appears only in Dan Hollis' (or is it Aura's) register listing? with no comments whatsoever (and ICYW it is not in the Compendium).

Thanks by advance

==========

A few years back- I came across, a large group of Adventure International, software etc. Basically I've got boxes and boxes of disc- in small cases) usually it's one game per case- and within the case are usually 3-6 disc. Some of these are normally alpha or "prototype" versions of the game and it usually contains what is labeled a "Master" disc.

AI had been based in the Orlando area, and this stuff had been placed in storage and ultimately sold for non-payment of rent. It would seem that this was the Adventure International "archives" or perhaps the separate backup storage- that was then lost or abandoned, Much of the stuff is AI, but some is under another name- so I suspect that they either succeeded Scott Adams' Adventure International- or perhaps obtained the rights to some of the stuff.(or were a spin-off).

I got only about 1/3 of what was available- but it includes Atari 8 bit, St, Commodore, 64, TRS-80 etc. But still there are probably 100 or so separate cases- and maybe 500 separate disc.

There is also some cassette based software.

My interest is primarily the cartridge based games....
Any idea what this stuff is worth?
Offers? ....
I'd rather move this as a group/lot-
But if there is some particular title- you really have to have-
if your offer will make it worth my while, I'll pull all this stuff out and search through it for specifics.

I downloaded Gemulator 98 and 2 versions of TOS, 1.04 and 2.06. I manage to get Gemulator to see both and then I've been able to run many of my old Atari programs but I'm have trouble with the Laser C development program.

Laser C loads- but- if I have Gemulator use 14 megs of RAM, Laser C will crash trying to open any code file or when attempting to make changes to it's config.sys file.

So, I adjusted Gemulator to only use 4 megs of ram on my Pentium, and now the above problem doesn't occur, but when I tried to compile a code file- it crashed and burned my PC operating system (Win95 OSR2)- I ended up with a black screen. I had to reboot, run scandisk, and it fixed a damaged file.

I don't get it. The author of Gemulator says it should work. I got a few messages from him, but few suggestions, and he seems to have given up on this problem.

The reason I still care to develop software with GEM and TOS is that I wrote some software that I've come to depend on in my conulting work. I now also have MS Visual C++, but that's a steep learing curve before I'm ready to try porting over GEM programs to Windows- I'll do it eventually, but in the short term I'd like to continue with TOS and GEM.

Anyone have any suggestions?

The Catalogue now has over 500 separate Atari Items.

1) New section of unboxed Lynx Games
2) New section starting for TT compatible game (feedback appreciated)

3) CD section mostly finished

Next will be working on the Utilities Section.

I plan for a pdf version of the catalogue or even a downloadable html...

Hi Nick

I think the pages are coming along fine but please do not use pdf,
I think html is better and above all slimmer. If you turn it into pdf
it gets 10 times bigger (not quite, but) and it isn't better in any
way.

Hi Nick

Yes I think that there's gonna be NAS 2K, if that is what you was
thinking about. I could let you know when it's final.

Hi there,
I've got the following auctions going on at e-bay for the Atari 2600 (VCS), Atari 5200, Atari 7800 & Atari 400/800 8-Bit computers. The really big find here is Kool-Aid Man with box & instructions for the 2600.

To check the status of all my games go to:
http://cgi3.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=csjjh@eiu.edu

Once there, just click on the itme number to see a full discription & place a bid if you like.

ATARI 2600 (VCS)

Item #	End date/time	Bid	Game discription
216037614	12/12/99 14:24	$0.01	AIR SEA BATTLE

I am trying to complete the job to make Atari NOS work with CAB.

I implemented in NOS the functions to get info and files from URLs. I start CAB in parallel in MagiC with SHEL_WRITE. All works well requesting urls and displaying sites in CAB (1.5).

Then I added the feature to do a post, to write in forms and send data receiving answers (search engines).

The problem is this: when CAB requests an URL the control goes to NOS, CAB becomes "freezed", all menus grayed out, no reaction to clicks or other events, so you can't even stop the actual trasnfer. THis is boring explecially if the site does not give an answer and you have to wait for NOS going to timeout.

Now I see there are some functions in CAB involving the AES, to display the actual status and this is good, but what about functions to send AES messages ?

NOS is now a GEM program with its own evnt_multi, what should I do to keep

CAB alive while NOS is doing the transfers ? This way you can interact with the CAB window while downloading pages, and stop the actual transfers (I hope).

I see for a good browser cooperation I should write my own browser, is there any free code around ? Don't say Natscape, I can't start from it 8^)

Can you give me the email address of Alexander Clauss ? He may help me in this process.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Any way of telling CAB to give over control? If your NOS is an Internet
program, CAB is able to let over (like: Fiffi for FTP, EMailer for E-
mails . . .)
    just trying to help,
    Claus

You can use a SCSI-I with an adapter called "The Link". Perhaps
SCSI-II with "The LinkII" but I'm not sure about that.

Hunt round for an old derelict PC. The 720K drives in those will work.

Try it on another emulator. See if it crashes there. You never know,
something in MegaMx may have got corrupted if it's been sat a while.

 rc> I'm sorry, never heard about NOS! What's that? "New Operating System"?
 rc> Something we haven't heard about in Europe?

Oh no, it's really famous and used, it's NOS = Network Operating System also
known as KA9Q, very popular for packet radio.

 >> CAB alive while NOS is doing the transfers ?
 rc> Any way of telling CAB to give over control? If your NOS is an
 rc> Internet program, CAB is able to let over (like: Fiffi for FTP, EMailer
 rc> for E- mails . . .)

It is not CAB that has to give control, the problem is the opposite: cab
requestes a web page calling a NOS function, that does not return until the
page is saved in the cache. Maybe this is how CAB works, i.e. it freezes
until each object is completely received or timeout, but I think it works
better with sting or Iconnect, but how ?

     The OVL file gives control back to CAB in short spurts.

How deep is the AES message queue for each app?

I open a window and send myself a MN_SELECTED message - all before entering the main message queue.

By my reckoning, that'd be two messages in the apps queue (the WM_REDRAW and my MN_SELECTED), however it appears that the sending of the MN_SELECTED message causes the computer to crash in, or just after, the appl_write call used to send myself the menu message.

I am sending the requisite 16 bytes, and the data within the message is all correct.

If I change it to calling my own mn_selected() function, bypassing the apps message loop, this problem doesn't occur.

This occurs under AES 4.1 when running under MINT and when singletasking.

--

All email sent to my inca address will fail, however I can now be contacted via an intermediary : gem at gem win co nz. I would like to apologise to the genuine respondents that this may inconvenience.

>Anyone have any suggestions?

Any decent emulator should _not_ crash the host OS, no matter what
the emulated programs do... (well ok, unless you allow direct
hardware access.) I'd try a different one... I use (rarely now,
but it is still installed) stonx, tho that may not be the right one
for you as its a unix program, running on FreeBSD here. (Unless
of course you want to put a unix or linux on your box besides the
windows but that would be a bit off-topic here. Here's a link:
http://www.freebsd.org)

What you could also try is a cross compiler, that would make the
compilations faster too as there's no emulation involved for that
anymore. gcc (GNU C, free) can be configured as a cross compiler
and there is a windows port of it too (called cywgin), although
i must say i haven't yet tried building a cross compilier on cygwin
myself, i have only done it on unix. (i was tired of waiting ages
for the compiles on the slow 68000...) I also remebmer i had to
apply external patches for the atari object format etc. (gcc itself
only knew the 680xx CPUs but not atari TOS) and atari binutils, i
think i still have the stuff somewhere on a CD but of course as it
is now several years old the patches will surely no longer apply
to the current gcc so you'd better look for a more recent version
yourself. (Or does someone here know where that could be found

now?) It _may_ also be that gcc now actually supports TOS by
itself (or MiNT, that should also work), but somehow i doubt it...

 HTH,

Hi there,
   I've got the following auctions going on at e-bay for the Atari 2600
(VCS), Atari 5200, Atari 7800 & Atari 400/800 8-Bit computers. The really
big find here is Kool-Aid Man with box & instructions for the 2600.

To check the status of all my games go to:
http://cgi3.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=csjjh@eiu.edu

Once there, just click on the itme number to see a full discription & place a bid if you like.

ATARI 2600 (VCS)

Item #	End date/time	Bid	Game discription

In uno strano messaggio del 11 Dec 99 maxilys@normandnet.fr (2:333/608.1)
scrisse al povero Mike De.Petris:
 m> Here we go! There comes ClockPoV as promised.

Oh, finally things get clearer on this subject too! Your program does not work here ! GEM programs are started in "chain mode" so start only after ClockPov is closed. TOS program does not start, and freeze ClockPov because a "single mode" is used.

The problem is not in passing tail and exec strings, this is just a different convenction of C and GFA I think, but a different way of working of shel_write. Have a look at the rest of the message to see the content of SINGLE.TXT that explains the start of programs in MagiC, you will find it is different from what you are doing. You should find a similar document about MiNT to send me to try to find the way to make it work in both environments.

BTW I think this experiment has already been done, and someone should have an answer to start a parallel program in both MagiC and MiNT.

---------- START OF CUT ----------
Description of "single mode" of Mag!X

==========

Position: Mag!X 1.12
Andreas Kromke, 4.3.93
English translation: Peter West, April 99

Mag!X distinguishes between three differently paired types of applications:

a) The application #0
b) Accessories
c) Other applications (ap_id > 0)

The following call serves for launching programs under Mag!X:

```
*
* int shel_write(int doex, int isgr, int isover, char *cmd, char *tail)
*
```

Warning: MultiTOS works in a way that is completely incompatible to previous TOS versions. The new calls are controled via <doex> (0 here is program launch with automatic isgr-identifier and 1 with manual isgr-identifier, etc.) while "isover", which is called "iscr" here, controls the ARGV passing.

Thre are 5 different possibilities to launch applications from within others ("magx.h"). Here are the parameter values for <isover>:

```
* #define SHW_IMMED      0                       /* PC-GEM 2.x  */
* #define SHW_CHAIN      1                       /* TOS         */
* #define SHW_DOS        2                       /* PC-GEM 2.x  */
* #define SHW_PARALLEL   100                     /* MAGIX       */
* #define SHW_SINGLE     101                     /* MAGIX       */
```

Of these, modes 0 and 2 are not supported by Mag!X. <doex> must always be 1, otherwise only previous shel_write() calls will be revoked (as in TOS 1.04).

1. SHW_PARALLEL
   A new application will be created. It inherits all standard paths and files from the current application. The new application runs in parallel to the previous one. One will only get an error code if a memory shortage occured during set-up. There is no message at the termination of the new application (no "death-of-child").
2. SHW_CHAIN
   This is the procedure under TOS. The program makes the call, and after terminating itself the AES launches the new program. SHW_CHAIN does not work with desk accessories, as these must never be permitted to terminate.
   The new program inherits the standard paths and files that the previous program had at the time of its launch. In general these are in turn the ones that the program had that earlier launched the "ancestor" of the application with SHW_PARALLEL. In the case of application #0 therefore the new program gets the standard paths of

the AES.
If DESKTOP.APP (shell of GEM 2.2) is installed as a shell, then Mag!X will insert the current path and drive before the filename.

3. SHW_SINGLE
Works like SHW_CHAIN, with the exception that before calling the program all applications apart from application #0 and #1 (SCRENMGR) are frozen. The programs are unfrozen once more after the program terminates as long as it did not make a new shel_write() call with SHW_SINGLE on its part.
One should add that from Mag!X 2.00 onward when calling shel_write in SHW_SINGLE mode the current paths of the caller are passed to the parent and hence to the new program. Warning: The paths of the calling program are destroyed after this, though this is not critical as the call following shel_write is generally a Pterm.

The loops for SHW_CHAIN and SHW_SINGLE look like this:

For application with ap_id > 0:

```
while(doex)
     start(isgr, cmd, tail);
```

For application #0:

```
while(world_is_turning)
     {
     start_desktop();
     while(doex)
          {
          if   (single_mode && single_mode_not_yet_activated)
               activate_single_mode;
          else unfreeze_programs_if_appropriate;
          start(isgr, cmd, tail);
          }
     unfreeze_programs_if_appropriate;
     }
```

How do I launch a program in "single mode"?:

a) Ensure that I am application #0 (i.e. ap_id == 0).
b) Set paths and drive for the new program.
c) shel_write(TRUE, isgr, SHW_SINGLE, cmd, path);
d) All important settings to temporary file or shell-buffer.
e) appl_exit()/v_clsvwk()/Pterm0.

How do I launch a program in "chain mode"?:

a) If appropriate set paths and drive for the new program and make a call
```
     shel_write(TRUE, dummy, SHW_SINGLE, dummy2, dummy3);
```
in order to set the paths for the new program (incompatible to TOS).
b) shel_write(TRUE, isgr, SHW_CHAIN, cmd, path);

d)   All important settings to temporary file or shell-buffer.
d)   appl_exit()/v_clsvwk()/Pterm0.

After the program terminates the shell will be reloaded automatically.
When calling the shell one gets in the command line (->shel_read) the
"magic" sequence (magx.h):

```
/* tail for default shell */

typedef struct
     {
     int  dummy;                  /* a null-word                */
     long magic;                  /* 'SHEL', if it's a shell    */
     int  isfirst;                /* first call of the shell    */
     long lasterr;                /* last error                 */
     int  wasgr;                  /* program was a graphic-app. */
     } SHELTAIL;
```

If <isfirst> is set then the status is to be read from something like
DESKTOP.INF, if <isfirst> is not set then one takes the temporary file or
shell-buffer.
<lasterr> is the return value of the program running previously. If this
was a GEM program then the error will already have been displayed in an
alert box. It is well known that the longword is negative if the error
occurred with Pexec itself; a program return value always has the high
word 0.
---------- END OF CUT ----------

Although the message pipe is ludicrously small under standard Gem (I
forget what) it isn't *that* small. My guess here is that the
MN_SELECTED is causing the AES to lock the screen manager. You could
perhaps verify this (or not) by changing that MN_SELECTED to (say) a
WM_RESIZE and see what the result of that is?

I dunno the format of a .ST file I'm afraid, but it would seem reasonable if it followed the same arrangement as the floppy it came off, whatever that happened to be according to the BPB in the boot sector.

>2) Is it possible to READ the bit of the YM-register giving the selected
>side of the floppy drive? It was not clearly stated in docs I have...

The Compendium says all the lines on that port are write-only.

I want to find a way to start a program in parallel in both MiNT and MagiC, but I see the shel_write call is different. How can this be solved in a manner that works on all systems, any free lib ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Thanks, I searched dejanews for it, but found nothing I can use.
I need a complete sourcecode in assembler to cut and paste.
Hm, maybe some other guy can help?

Kind of widely xposted, but could you give a bit more info about your problem?

For instance, the Atari has built in floating point and most people would just use that, but we don't even know the range of numbers you need or even if you need floating point answers.

I don't need some routines that pull a squareroot and leave a 128 bit
integer value or so.
Just things like:
Pull squareroot of a 16 bit number and leave a 16 bit result in the
zeropage and rest in Accu or something like that.
Or multiply two 8 bit numbers to a 16 bit result.
Divide 16 bit number by a 16 bit number and leave result in 16 bit
Zeropage-adress plus rest in the accu.
I have division and multiply routines here, but they are very slow
because they use ROL and ROR.
What I need is especially the routine for pulling a squareroot and maybe
2 routines for division and multiplication that are very fast.

And the important thing is that it runs on a plain 6502 (which has no
floating point instructions).

OK, this one is fairly easy. The square root of any 16 bit number will be 8 bits or less. The easiest way to do this is a table with precalculated numbers.
result/from range
0/0
1/1-3
2/2-8
3/9-15
4/16-24
...
You need a table with 256 results/bytes, and the ranges are defined by 512 16 bit numbers. For ~1200 bytes of table and probably less then 50 bytes of code for the decision making, it should be the fastest way to go.

> Or multiply two 8 bit numbers to a 16 bit result.
I am kind of cheesy when it comes to this kind of stuff. I usually just have simple routines like mutiply by two, then call it twice to get times 4, 3 times to get times 8, ...
Ditto for times 3.
So times 6 becomes call 2x routine once, 3x routine once etcetera.

For good routines, do you have access to Levanthal, Assembly Language Subroutines for the 6502? I think that is the title and it has everything you ask for, 16 bit math, BCD, ...

The only other sources I can think of, at least from the Atari side would be the Public Domain Action! runtime package. There may be some others, I think Charles Brannon's<?> assembler for the C64/Atari in Compute included math routines so you could do things like.
LDA AVAR/$FF
It should be pretty easy to 'borrow' his routines for multiply and dividing 16 bit numbers.

If you're into a little homework, Microchip (www.microchip.com) has
assembly source available for 24 and 32 bit floating point. I've only
used basic functions, but they've other functions (including square
root, IIRC). The routines are pretty short and have well specified
runtime properties.

The tricky part will decyphering the evil assembly mnemonics and
adapting them to the 6502. It could be argued that PICs have an

encrypted native instruction set given the strange properties of the processor... ;)

There does exist a "fast floating point" set of routines for the Atari 8-bit. I'm not sure which functions are supported.

I hate to say this, but using those 2 instructions is the only way to go unless you have a large table. I had to work out percentages using ML. I looked at what was around, routines etc and how fast I wanted them to go. Finally settled on using the OS floating point routines to do the multiply and divide. I wanted a decimal point in the calculation and speed was not an issue. And it was slightly eaiser to convert BCD to screen bytes.

Hi Jos!

JDB>In the first place, the desktop is not redrawn. It is only redrawn
JDB>for the portions that are changed afterwards, i.e. when moving or
JDB>closing windows.
form_dial(FMD_FINISH, 0,0,screen_width,screen_height) will redraw the whole
desktop but all other windows too.
Possibly you could send a redraw message for window 0 to it's owner. But I
have some doubts that this will work...

JDB>And in the second place, the "new" desktop is always the old-
JDB>fashioned grey background instead of the coloured background you get
JDB>under a modern OS, like MagiC.
I consider this a bug in the OS

Bye

Joerg

Hi all!

i'm looking for a small nice subroutine, which allows
me to detect what is exactly the 680x0 processor type
avalaible, into the system.

does anyone have got such nice code ?

Laurent

MiNT checks the CPU-type, if you look in the sources I'm sure you'll find
what you're looking for.

Use a desktop-sized form_dial(). (This will also cause all currently open
windows to be redrawn)

Or just step through the WF_FIRSTXYWH/WF_NEXTXYWH list for the desktop
window, issuing form_dial() calls for that rectangle.

It had local variables!!! Quite novelty at the time, and no need for
gosub either, you could call functions by name - oo, and it also had
procedures as well. Quite Pascal-like it was. Rather handy that
co-incidence was, as Pascal was what the idea was based on!

And an assembler built into Basic.

I was about to say: "That's the first thing I tried but it doesn't
work", when I realized I had put the form_dial() call _before_ the
wind_set() call. :) Shame on me!

>I consider this a bug in the OS

Yes, it most certainly is. To ASH, then!

Thanks.

I don't really know whether I have a problem or not,
but my Hard Disc is full of weird little files called
Aa,Ab or just A. They can be viewed only by three
programs I know of: Kobold (in GEMDOS-modus only),
XBoot's fontselector, CDRecorder Pro and Diskcake
(oops, well four then).
They are (what's the English name for that)
inextinguishable*, even when i've changed that on the
Desktop, I can't get rid of them. They've got sizes
like_minus_1 or_minus_65536 Bytes, are dated either
00.03.1980 or 31.15(!).2107 and seem to do no harm.
I've brought up this item in an Atariforum, and
somebody said it were dead corpses of the long
filenames enabled under MagiC - this could fit,
because they only occur on partitions that have or
have had long filenames enabled.
Anyway I am a little uneasy. Anyone having an idea or
even met and coped with tihs problem before? Thanx!
Claus

These are pseudo directory entries used by VFAT to store the long filenames. Unfortunately, you didn't write whether you're experiencing them with MagiC or with TOS. And I also didn't quite get what you mean with "They can be viewed": Do you mean only these programs will show those filenames, or the file contents? The latter would be quite strange, as all these VFAT entries have a start cluster of zero, which is equivalent to an empty file.

Assuming that you're seeing the entries with TOS, try HideVFAT (best first in your Auto folder, if already XBoot gets to display them). You can download it from
http://homepages.hrz.tu-darmstadt.de/~gryf/software/hvfat_r1.lzh

Besides, these entries usually don't do any harm, although trying to delete them will cause your long filenames to disappear, once you switch back to MagiC or MiNT with VFAT enabled. But, with TOS alone, HideVFAT will help you not seeing the pseudo entries anymore, so they won't disturb you. Only software that directly accesses the disk (e.g. disk editors) will not be "fooled" by HideVFAT.

Ciao

Thomas

I'm sorry for my inaccurate use of the word "viewed": It should have read
"seen" of course. I see these files with MagiC and with TOS but only on
the partitions that have or have had long filenames. So I think your
solution is perfect. I will try not to think about these files, that
really made me nervous for a while!
Thanx,
Claus

Subject: PROGDEF stack
Date: 1999/10/12
Message-ID: <7tu04hjnr1@newshost.comnet.co.nz>#1/1
X-Deja-AN: 535614797
Organization: Comnet Technologies Ltd, Wellington, NEW ZEALAND
Newsgroups: comp.sys.atari.programmer

I am currently working on a listbox to go into my app.

As part of this listbox, I have used a PROGDEF, which will be used to display the appropriate data.

However, I am wondering how much stack space is there that I can use while drawing my listbox.

The code looks something like this: (in Lattice 5.60)

```
__stdargs __saveds item_listbox( PARMBLK *pbptr )
{
     ItemEnum ie;

     ...

     if( itemFind( firstitem, sizeof( ie ), &ie ) )  {
          do  {
               ...
               v_gtext( handle, x, y, ie.data );

               v_gtext( handle, x2, y, ie.data2 );
               ...
          } while( itemNext( &ie ) );
     }

     ...
}
```

The ItemEnum struct is around 250 bytes, and the itemFind/itemNext funcs also have a local copy of the struct (which is filled in and then copied into the one whose pointer is passed to these funcs)

All up, I'd probably need around 1k of stack space. (My TOS 3.05 machine seems OK with that figure, but I appear to overwrite system vars used by the AES/VDI if it gets too much beyond that)

Can I rely upon this amount as being available on all TOS versions, or are others more/less restrictive? (I no longer have easy access to other STs, so cannot check this out for myself)

JET MOTO 3
THE RUSH IS BACK!

Sideswipe enemy racers, hang a hard left at the vertical grapple, and speed your way to the finish line! Jet Moto 3 takes you full throttle through 19 obstacle-filled, bone-smashing environments, as you attempt to conquer subterranean graveyards, ancient cities, volcanic eruptions and alien worlds. 11 insanely fast, all-terrain jet hover bikes, including new riders such as Angel and Convict, will take you on the ride of your life as you jostle, sideswipe and fight for position against the most challenging racer AI to date. You'll feel every bump, bruise and crash with the all-new 3D racing engine with MotoPhysics?, delivering blazing fast gameplay and crisp, beautifully detailed 3D graphics. Jet Moto 3. THE RUSH IS BACK!

KEY FEATURES:
? Race any of the 11 ultra-realistic, all-terrain jet hover bikes. Old favorites like The Max, Wild Ride and Vampeera team with new riders such as Angel and Convict. Each rider/bike boasts his or her own performance ratings for acceleration, top speed and handling.
? All-new 3D racing engine with MotoPhysics? delivers blazing fast gameplay and beautiful 3D graphics. Experience outstanding handling and even an occasional horizontal and vertical grapple!
? 19 treacherous, bone-smashing environments to conquer, including an ancient Inca city, a subterranean graveyard, the gut-wrenching SkyPark, as well as the wildest, most thrilling stunt tracks ever designed!
? Feel the effect of eleven different racing surfaces, such as ice, wood, metal, rock, lava, grass and concrete.
? Experience realistic weather effects including snow, rain and night racing.
? Challenging AI jostle and fight for position by crowding or side-swiping other players.
? Rip it up or get wasted in 1 Player modes (Single Race, Season, Circuit and Practice) or 2 Player modes (Single Race or Circuit) with 4 season difficulty levels: Novice, Semi-Pro, Pro and Expert.

JET MOTO COMPARISON

Does anybody know how to detect the maximum size of char arrays for the name and info line of windows? The AES of my Mega crashes when the line length exceeds 80 characters, but a more modern AES can handle much longer lines, of course.

Can anyone supply me with details of how to detect, and select the
frequency on the external clocks which connect to the falcon's dsp port?

I believe that there is the clock that comes with Cubase Audio Falcon,
and, Softjee's NewClock. Are they the same?

Salut/.

 You could try Optimize v 2.8 it understands longfile names (Its the
 prog I use on my longfile name partion, Diamond Edge on the rest
 which just deletes all long filenames) I can not remember what web
 site I got the prog from.

Question for the ST programming experts here:

I'm not a programmer (unless you count my BASIC days on the 8-bit Ataris), but I was wondering if anyone here might want to try converting a small PC utility program that's designed to work with Atari 8-bit files (games and such). It basically converts different 8-bit file formats to others etc.

The author has many Atari 8-bit utilities on his page, and all his source code is available as well. And he told me he has no problem with someone writing an ST/Falcon version if they're so inclined.

Anyway, if anyone is interested, I'll post here with a followup directing you to his web site and the program in question.

Thanks!

P.S. My reason for wanting this is that I have a Falcon, as well as an 8-bit Atari, and would like to convert and work with a variety of files for the 8-bit using this utility program. But unless I buy a PC, this isn't really possible.

I must be missing something obvious here but what the heck... ;-)

static ItemEnum ie;

No stack used - twice over because itemFind/Next no longer need their
local version as they'll be modifying 'ie' directly.

MagiC has a limitation also - somewhere between 110-200 chars iirc.
One of the Cab versions got caught by this. Truncate to 80 is about
the only safe way methinks.

Post the url. I don't mind taking a preliminary look. Keep your
fingers crossed the source isn't "DOSified" - or I'm out of there!

In a GEM program I am working on I use the AES wind_update() function with
BEG_MCTRL and END_MCTRL to gain and release control of the mouse. This
prevents mouse clicks from affecting other applications while my app has
mouse control.

However I have noticed (tested under N.AES and MagiC AES) that this also
has the effect of preventing screen updates. Other applications never seem
to be able to draw on the screen while my application has mouse control.

I thought that was what the BEG_UPDATE and END_UPDATE arguments to
wind_update() were for, but I am not using these.

Why might this be happening and how could it be avoided?

Thank you for any hints.

The BEG_MCTRL includes automaticaly a BEG_UPDATE and via versa. That's because of avoiding deadlocks.
Just imagine two programs:

```
1.                  2.
wind_update(BEG_MCTRL);
                    wind_update(BEG_UPDATE);
wind_update(BEG_UPDATE);
// couldn't perform
                    wind_update(BEG_MCTRL);
                    // could't perfom, too
                    // deadlock
```

Any wind_update(BEG_UPDATE) or BEG_MCTRL essentially causes all other
applications to halt in their evnt_multi() loops or when they try to do a
wind_update(). There is no reliable way around thatis that I am aware of.

:                 // could't perfom, too
:                 // deadlock
```

Hmm, it seems somewhat pointless having both *_MCTRL and *_UPDATE modes if they in fact both do the same thing. Is there a way around this if I want to use only BEG/END_MCTRL without UPDATE?

The result I want to achieve is that mouse clicks would not affect other apps but other apps could continue to run otherwise, draw on the screen etc.

Hi all,

I wonder which AES message I should look for to know if a window has
been shrunken, so that it is only the moving bar left of it? This
happens if you double click the window bar in eg MagiC. I need to know
this to be sure that updating some text inputs is OK.

Please help! Anyone?

Best regards,

Joakim

Hi!

Joakim H⍰gberg <gokmase@my-deja.com> wrote:
> I wonder which AES message I should look for to know if a window has
> been shrunken, so that it is only the moving bar left of it?

These are WM_SHADED (22360) and WM_UNSHADED (22361). Both supply the window handle in msg[3], and both are asynchronous, i.e. the state of the window may have already been changed again when the message arrives.

To check whether a window is shaded, there's a little trick (the window must be the top window for this to work): Get the first element of the window's rectangle list (WF_FIRSTXYWH) and compare it with the window's full size (WF_CURRXYWH). If they're not identical, the window is shaded.

I haven't tried yet, but it may be enough to check whether the first rectangle is of height/width 0. This can't happen for a topped window, unless it's shaded. For background windows, this is possible, so you can't use that method reliably in this case.

Ciao

Thomas

P.S.: In case you wonder why these two message have such a high number:
They were orignally introduced by WINX, and WINX used messages that started with 'W' to prevent collisions with existing ones (WM_SHADED is 'WX', WF_UNSHADED is 'WY'). Fortunately, the authors of MagiC and N.AES decided not to change them when they implemented shading into their systems.

TB>is shaded.
There's a better solution:
wind_get(WF_SHADE) returns the current state in *wi_gw1 (0 = not shaded).
WF_SHADE is 22365

Bye

Joerg

I don't think so, and the pointless discussion in MausNet was already
enough on that topic, at least for me.

> There's a better solution:

Just that WF_SHADE does not necessarily exist. And I don't know whether
there's an appl_getinfo() opcode to reliably check for it.

Ciao

Thomas

Hi all,

Is there a way to support the scrolling wheel on newer mice on atari (or emulation on MagiC-Mac/PC/etc)? I guess it is possible to connect these newer mice to an old atari, and then wonder if it is possible to add support for the signal from the wheel.

Anyone?

Cool. Primarily I am interested in his [Ken Sider's] software that takes a bootable Atari 8-bit floppy game, and converts it to an individual FILE. I think he puts all his source code for his various [PC] Atari 8-bit utilities together on his page.

BTW: A second programmer [Jindrich Kubec] says he has a similar PC utility with source code available on his site, which I've listed after Ken Sider's information.

Anyway, here's the information:

From: Jindrich Kubec <kubecj@asw.cz>
Newsgroups: comp.sys.atari.8bit
Subject: Re: Converting bootable disk games to Files

My utility ADIR is able to extract those 'k' boots. It's C/CPP source
and it should build on any GCC dev platform. If you have GCC, you can
mail me and try it.

Did anyone of you try to compile the MIRACL library with a TOS C compiler? I
tried with Pure C, but obviously some of the data types used in Pure C are
not compatible with MIRACL, especially the int type: MIRACL requires a
32-bit int type (which would be long), and a double long integer type. Is

there any C compiler that has double long (64-bit) integers?

Hi Thomas!

TB>Just that WF_SHADE does not necessarily exist. And I don't know
TB>whether there's an appl_getinfo() opcode to reliably check for it.
AFAIK wind_get/set returns an error if called with an illegal mode.
And there also ist an appl_getinfo call of which I also don't know how
reliable it is. But my info about it is incomplete so I relied on the return
code of wind_get/set

Bye

First of all apologies if you have read this message in another newsgroup.

16/32 Systems are setting up a new domain with full retail catalogue. At the moment we have a basic catalog set up and will be expanding on this every day, we plan to publish articles, help files in a general area as well. I would like to make this a first or even second stop for Atari Users. The catalog at moment is fully useable and if you wish to order then please do so. Whilst we are knocking this area in to shape we will confirm each price before sending.

However I require input, please browse pages as they come if you wish and let me know what you would like to see either available or as general interest. If you wish to contribute or have any other queries please email below. If you wish just to be kept informed then email me and I will add you to the list.

The reasons for this are basically due to personal (sickness) matters I am closing my shop and concentrating on Mail Order plus Internet stuff plus my contract work. So I am going to have a lot more available time and I might as well use it.

The URL at the moment is http://catalog.zen.co.uk/actinic/16_32_SystemsX/

You can now email me on nick@1632systems.co.uk or
nahrlow@cix.compulink.co.uk

Thanks for your time

Nick Harlow

I've got a book:

    6502 Assembly Language Programming: A self-teaching guide

I'm wonder what, if any, value this has.

If the value is quite low, I'll just hang on to it as a reminder of
simpler days in the history of computing.

Cheers!
J5rson!

Ah, happy memories! This is a "bible" for the BBC micro and the Oric. The 6502 HAS been incorporated into some domestic equipment (washing machines etc.) but you are unlikely to find much call for it now.

I'm sorry, but as far as I know GFA does not work under
MagiCMac. I don't know, though, wether there is a patch program
(like a la card) that enables just that.
Falke Verlag (www.atari-world.de; in german) has a CD containing
GFA 3.6 TT and a LOT of programs. It's very cheap, I bought one
myself, but you're completely on your own when installing it.

Hi Andrew,

GFA does work under MagiCMac. However, you⍰ll need a path for both
interpreter and compiler. There are two patches available, one is A la card
by Reiner Rosin. Have a look at
http://www.rosin-datentechnik.de/rosin-online/software.html

With that, it⍰ll run just perfectly...

if I get stuck, this is what I will go for, but is there anywhere that
will sell me a copy with the manual etc.. ?

Thanks for the replys

I've written a simple client/server program for my Atari (the client).
The server is a PC running linux. The serial port is set up to 115 200
bauds. I think I can go up to 11 520 REAL bytes per second, but the
first test I've made show me it is about 47 000 REAL bytes (I'm
transfering an Atari low resolution picture, 32 000 bytes and it takes
more than 6 seconds). I'm using a socket and the average size of packets
is 1500 bytes.
I know I can compress the picture, but first I want maximum speed from
hardware. Does anybody have an idea ? Does the TCP/IP adds so much
informations to make packets ?

I have an old SUPRA drive. I't been hacked some, as it used to be a 20Meg, and I'm not sure what it is now. probably 30 or more. Since I seldom use my ATARI equipment anymore, I'm not sure, but if you're interested let me know and I'll check into it. It has the built in ATARI to SCSI adapter mounted inside, so it's plug and play. If you'r interested, email me directly.

Can't really suggest anything atm - depends on the above.

>Is there any C compiler that has double long (64-bit) integers?

GCC might have something buried in it but frankly I doubt it, unless
someone has silently been updating it. I've asked numerous times for
the latest TOS gcc sources but to no avail. :-(

No, sorry, this printer uses the Atari RAM as pagestore and, because of
this, is quite foreign to Windows.

Didn't Ataris PC-clones in the late 1980s/early 1990s have such a port?

Or have I just mis-recalled a rumour?

If you visit my web site you can download a utility which will let you use the SLM
printer using an ST as a printer server. Basically you connect the serial ports
together with a null modem cable and use an HP 300dpi driver on the PC with output
diverted to the serial port.

Only one more day until Friday, November 6 (opening night of CinciClassic)!
Response has been overwhelming!

This will likely be the final update. Check the web site or email us if there are any pressing questions.

Tentative Schedule (all times subject to change):

Convention hours:
 Friday 7pm - 10pm
 Saturday 9am - 10pm
 Sunday 11am - 2pm

Extra late night gameplay likely for Friday and Saturday
Sunday is typically just packing up to go
Auction 4pm Saturday
Arcade tournament Saturday until the auction (mystery game)
Other tournaments 1pm - 4pm Saturday (Bomberman plus 1 or more mystery games)

Official web site: http://ic.net/~craig/cinci/
Phone number: (513)272-4000 (do not call before 6pm Friday)

Things you might want to bring: Power strips, small televisions, folding chairs. Classic games for playing, trading, demonstrating, and bragging.

Here are some of the latest news items.

News item: William Moeller has announced that he may be coming to the show to demo the INTV2PC hand controller, as well as the Intellivision Keyboard Component and the unreleased Colecovision game "Steamroller" (written by the author of BeamRider, David Rolfe)

News item: Current new Lynx games (PONX, Lexis, Sokomania, SFX) from Songbird Productions and others will be for sale at CinciClassic. Also, upcoming Jaguar games (Protector, Skyhammer) from Songbird Productions will

be available for demonstration and play.

News item: Prizes and giveaways from Hasbro, Intellivision Productions, and others will be featured at CinciClassic.

News item: William Cassidy will be on hand to demo the Odyssey 2 multi cart on Saturday.

News item: Many issues of Classic Gamer magazine will be given away.

News item: Several hundreds of dollars worth of tournament prizes donated by popular video game companies and private collectors will be given away.

Cincinnati weather is going to be in the mid 60's all weekend and partly sunny.

Hope to see you there!

Go to Atari hardware page, and look for gemmice.prg - it's a driver for

connect pc mouse to serial port. If u want then i have a sources of this
..

May force will be with you

It's a shame this stuff is going to waste. I just don't use it anymore.

SEAGATE ST-157N (45 Meg) SCSI HD $10
MAXTOR XT-8380S (380 MB) SCSI HD $50
SC-1224 Color Monitor (Minus Vid. cable) $60
Golden Image Hand Scanner (4", mono) with Scanning tray $60

I'm in Florida in the USA, and buyer must pay shipping. If interested in
any item, let me know where you are and I'll check into the mailing
cost.

OK, the basic web pages are now up, only two pages but it will be growing v.soon and hopefully v.fast.

The link is http://www.1632systems.co.uk from here you can link to Sales catalogue which should now be functional if a little sparse (graphically wise)

My thanks to those of you who have commented on catalogue and taking comments on board.
1) Hopefully postal rates are now sorted..
2) more graphics will be added with longer description, this will be over next two weeks.
3) On the web site, we will be archiving help files (cheats) for Falcon , Lynx and Atari games. These files will be available for download.

We do have other projects in mind so please let me know what you want to see.

Well, looks like a tremendous amount of job, as you shall have to rewrite
most of BIOS and XBIOS layers of TOS ! No MMU, no WD1772 controller, no
Yamaha 8192 chip (sound and parallel port), no MFP (serial port), no regular
ST interrupts : every basic I/O function has to be re-written !

Might be easier to replace your non-Atari hardware by a regular ST and build
the additionnal hardware required...

Warum musst du ein solches portierung ?

Good luck !

Hi Joel

Sorry, I had overlook that this is an english spoken newsgroup.

>Warum musst du ein solches portierung ?

The reason is very simple. We have a ready made 68k - handheld lcd
battery driven device and need a OS that will good work with this bit
of memory. (4MB Rom / 8MB Ram)
And I think the old TOS is a good choice for this job.

No disc or harddisc routines is necessary, only flash-rom-disc.

The problem is that all TOS's are still copyrighted and owned by companies.
No sources available.

Ok, I could answer on German but let's use good ol' English.
One of the few companies that have the TOS sources is the Milan GbR so
you should ask them.
However, there is an alternative to TOS: MiNT! It is already ported to
the Macintosh (MacMiNT) and runs most TOS programs (no GEM) quite well.
Sources for MiNT are available so you'll only have to write code which
emulates some parts of TOS. I also read that MiNT was ported to other
68K industrial machines but I'm only sure about the Mac version.

Try a web search for MacMiNT. It should have a homepage somewhere.

Greetings,
Matthias.

What kind of hardware? The uCsimm?

> weiss Tips und Infos?

Well, you can't find the sources for TOS anywhere, and since you have to
rewrite (X)BIOS entirely anyway, why not base it on MiNT? If you go
through with this, please let the rest of the world know :-) I almost
ordered a couple of uCsimms and LCD-displays in order to port MiNT myself,
but quickly came to my senses ;-) It runs Linux very well already. Btw.
that's an idea - port oAESis/oTOSis to uCLinux! Now *that* would be cool!

IMHO the best choice is TOS 2.06 (the highest rev. no for 68000)

Most of the job seems to be the removal of unnecessary parts (handling
of the FDC, DMA port...), and maybe adapting uncompatible parts
(RTC, UART... if your device has these)
next you'll have to emulate VBL interrupts and the 200Hz GEM timer if
you intend to use AES
If the ROM on your system doesn't map normal TOS adresses you'll have
to relocate the entire TOS
Last, I think the emulation of the cartridge port is the best way to
launch your applications (directly if they are <256K, or with a
ROM-disk driver if they are >256K)

You can also consider porting MiNT, but I don't know if it is
completely TOS-independant.

Hi

No it isn't the uCsimm - but nearly the same.
There are not very much varations to design with the 68328.
Do you really have uCsimms with running uCLinux?

No, I haven't ordered any (yet). I got a mail from a fellow in California
who saw it at a Linux-convention though. I would really like to get one
for my modem, I could have an entire firewall/mailserver *inside* the
modem if I want to :-)

Hi

I'm playing with MiNT on my Atari TT for the last three days.

xxx What is MiNT? xxx

It looks like an UNIX but ....

Is MiNT intended only to change the TOS, or is it a LINUX or is it a
LINUX for 68k Processors with an other name.

i'm a little confusing...

It currently replaces GEMDOS, but it use (X)BIOS to access the hardware.
MiNT runs on the Mac as well, the MacMiNT-people have a minimal
TOS-implementation (basically just a minimal (X)BIOS-layer above MacOS)
which I'm sure you'll find very useful. I don't have a Mac myself so I
don't know the details.

It's an enhancement of TOS, to be more specific it replaces the
GEMDOS-part of TOS. It's very unix-like, but still compatible with GEMDOS.

Exact, FreeMiNT requires the XBIOS and the BIOS to be present. The GEMDOS
is replaced and also a little bit of the BIOS, in order to be able to
manage ttys like Unix.
FreeMiNT provides a very powerful file system, really better and faster than
TOS's one.

Basically, MiNT was designed to be able to run many TOS programs at the same time. Its creator, Eric Smith, used many things from Unix, which explains why MiNT is so close to Unix, Linux, SunOS.

Its purpose is not to be a Unix, as there are already FreeBSD and Linux available for this. MiNT has to run TOS programs, thus it's compatible with Atari's GEMDOS.

But the fact is that many FreeMiNT developpers are Unix addicts and they most work on FreeMiNT compatibility with other Unixes.
So FreeMiNT is more and more compatible with Linux, Solaris etc, and it's still very compatible with GEMDOS.
Si you can use X11 or GEM with it !
Great isn't it ?

Hi all!

I tried to adapt a small code from Amiga source, which is able to detect the 680x0 processor. I tested this one with my Falcon+Ab040 successfully but i need help to test it with another Atari to be sure that this code is ok.

anyone can test with it a standard 68030, 68020, 68010 and 68000 ?
I know that there are not a lot of Atari with 020 and 010 ;-)

send me a mail if you want the PRG and sources...
Thank for your help.

There are, actually.

Upgrading a 68000 machine to 68010 used to be a cool experiment
(the chips are pin-to-pin compatible, if I recall) because there
was some hint that TOS was developped on 68010-based systems at
Digital Research.

There are some accelerator cards which replace the 68000 with a
68020 + FPU (such as the Veloce+ by The Upgrade Shop in UK).

Finally, Atari clones are usually 68040 or 68060-based.

Hi everybody,

Does somebody have at reach of hand the sources of a routine for MIME (Base64) decoding?

I'm looking for something simple in C or Pascal. I don't need routines able to handle splitted files, MIME nested up to 1000 levels, MD5 (what that?) and such complicated things. I just want to be able to take a Base64-encoded text block and to turn it into a binary block.

Thanks for all,

Hi,

I don't know whether anyone writes programs in GFA Basic anymore? I've
just started tackling the AES-stuff and I don't know why this stuff
sometimes works and sometimes doesn't. I'm running the 3.6 on a Falcon
and work after the 3.5 manual and books on 3.0.
Are there known problems with GFA on Falcons?

The editor may not like some Falcon modes, but the compiled results
will work fine. There is program to solve the mode problems with the
editor. Check my www below for some GFA support and demo of the
editor patch.

Many still use GFA, such as myself. ;-)

Attention Atari Programmers!

For along time now we have been needing a simple program such as a TTP that will convert Apex Media .FLC and .FLH animations and videos into common formats such as MPEG, .AVI and .MOV.

There are currently ways to do this but most of the time one has to take the FLC/FLH apart into TGA Images.

Is anyone working on a program to do this a better way?

If not, then someone should really do this.
I know that there are alot of good Atari programmers left who are capable of this. I've seen some Great Demos and etc.

Why not put all that good talent to use a create a nice program to convert Apex .FLC/.FLH files?

We also need a program to capture video and sound together from a Expose and Screen Eye and save it out into a common format such as AVI/MOV/MPEG.

Surely it cannot be that hard to do this, With all the great video players such as MPLAYER and ANIPLAY around I know that this can be done.

Hi !

i'm not sure that TOS will be happy with a 68010 or 020 inside a STF,
instead of a 68000, because format word are not supported by TOS.
(I think !)

A lot of work will be requiered to patch TOS and allow it to understand
Format word. (And somes others minors things like move from sr, became
supervisor mode).

Hi !

i'm not sure that TOS will be happy with a 68010 or 020 inside a STF,
instead of a 68000, because format word are not supported by TOS.
(I think !)

A lot of work will be requiered to patch TOS and allow it to understand
Format word. (And somes others minors things like move from sr, became
supervisor mode).

Laurent

Well, the metamail package should contain sources for that.
Additionally, recent versions of uudecode also handle base64-decoding,
so it's maybe also worth a look.

Ciao

Thomas

The original compiler library had some LineA calls in it and
some problems with the init section, all of which are easily
corrected with some patch programs. Again these fixes are
available on my gfa pages... ;-)

Probably, yes. I'd really like to see that. But I'll keep my Atari's stock now.

>Supercomputer? my ***!! there's nothing super at all about the Apple, there
>never has been and there never will be. All you get is a nice bubble full of
>marketing hype. Once you switch on the flashy box it's the same old hat...

No it isn't.It's a well-designed case with a high-quality computer inside running an OS that allows me to get my work done without crashing constantly. Unlike a certain widespread OS from a certain Redmond software company.

>BTW: what the US government allows or not is ridiculous... If for example
>Saddam wants a truckload full of G4 processors, he'll have them tomorrow.

>anything illegal. Just "free trade" :-)

I wasn't saying that the US export restrictions aren't ridiculous. I know that people that want these machines will get them, one way or the other. There are discussions going about raising the specs. All I said was that these restrictions apply to the PowerMac G4, because by US government standards, they're supercomputers. A stock Atari, Amiga, or any Wintel machine isn't. According to these standards.

As for free trade, trade is not always as free as think. If you buy a G4 in Belgium, wether or not you are allowed to export it to Saddam Hussein depends on Belgian export law. There might just be some restrictions on that. Of course, you could just do it anyway without registering the export, but that would still be illegal.

>Apple, IBM and Motorola are Multi nationals designing and producing chips,
>processors and parts all over the world. How do you control a Multi
>national firm? What makes you so sure that the G4 is a 100% developed in
>the US processor? Ever heard of India? I wouldn't be suprised if that
>country in on the "certain list" also :-))

I don't think that IBM and Motorola have their processors produced in countries like India. Maybe a lot of more "mundane" chips are produced there, but not the cream of the crop. And I'll bet that their top designers are in the US also.

Apple has outsourced production of the iMac to companies in Taiwan and Korea, but the PowerMacs are being produced by Apple at Apple's factories in the US, Singapore and Ireland.

>Times have changed, we live in a global community, ever thought about the

>somewhere on a server in the Phillipines. That famous export list is nothing
>more then a way to control economies and protect the home market.
>To use the words of the Great Guru himself: "Let's think different"

My bank account is most certainly not administered in the US, it's on a huge mainframe in Amsterdam. That mainframe runs software that I have written. Contrary to what you may think, if you have a bank account, it is probably administered on a big mainframe that is fully owned by the actual bank itself.

Not on a big server in the phillipines. Banks are very (*VERY*)
privacy-sensitive operations. They develop most of their software in-house and
run it on their own mainframes.

Hi,

I'm writing a routine to load a PI1 file in VB (eaugh!) on a PC(aaahh!), so I can put screenshots of my old games on my website. I can load the palette information correct, then next is the screen information.

What I can remember is each byte is two nibbles(4 bits) - the high one gives the colour (palette index) of one (even numbered) pixel, the low nibble gives the colour of the next (odd numbered) pixel. Yet when I run my code, it looks like I've tried to load the picture in the wrong resolution! (black vertical stripes & distorted graphics)

Now is this anything to do with the fact the atari & PC stores bytes the in different ways (big & little endian) - I dont know if they do, but I should imagine it would cause a problem anyway!

Or is it anything to do with something not being aligned on a word boundary (erk - faint memories of atari programming!)

Please let me know if you can help!

Cheers,
Simon.

Here is a snippet of code (in VB - should make sense!) I'm using to display the image:

```
    nCCount = 1
```

```
    For nYLoop = 0 To 199
        For nXLoop = 0 To 319 Step 2
            nCPointer = Asc(Mid(strImage, nCCount, 1)) And 15
            imgScreen.PSet (nXLoop + 1, nYLoop), RGB(nPalette(nCPointer, 0),
nPalette(nCPointer, 1), nPalette(nCPointer, 2))
            nCPointer = (Asc(Mid(strImage, nCCount, 1)) And 240) / 16
            imgScreen.PSet (nXLoop, nYLoop), RGB(nPalette(nCPointer, 0),
nPalette(nCPointer, 1), nPalette(nCPointer, 2))
            nCCount = nCCount + 1
        Next
    Next
```

A PI1 has the format

1*word (usually 00 to indicate low rez)
16*word for the palette
32000 byes for the picture data

The low rez screen is in words for each plane.
1st word = plane 1
2nd word = plane 2
3rd word = plane 3
4th word = plane 4

the 5th word is the next word across the screen (screen base + 8).
This sequence carries on until the screen is filled.

This is one of the pi1 formats.

Degas Elite format saves files of 32066 bytes in size, because they
contain palette animation.
So
1*word (00 low rez, 01 mid rez, 02 high rez)
16*word palette
16*word palette animation
32000 bytes picture data.

A small hint... try run some picture conversion program on your st,
like picfib or Gemview. You can make a batch, generating all the .gif
you need.

Greetings all,

I wonder if any of you have got information on the colour icon file (*
.CIC) created by Ataris resource editor? How does it handle bitplanes,
mask and stuff?

Thanks in advance! :)

Regards,

Joakim

That may (or may not) depend on the source and target formats. The
conversion, should it need applying, is simple provided you are
dealing with whole word and longwords. (ie if you want a real headache
try and deal with 12 bit FAT's as used by floppies).

16 bit word: exchange hi and lo bytes (eg $1234 -> $3412). Job done.

32 bit longword: exchange ho and lo words, then do word conversion on
each word (eg $12345678 -> $78563412).

To clarify:
$1234 5678
$5678 1234 <- word exchange
$7856 3412 <- byte exchange on each word.

<DEGAS Elite>   *.PI1 (low resolution)
                *.PI2 (medium resolution)
                *.PI3 (high resolution)

1 word          resolution (0 = low res, 1 = medium res, 2 = high res)
                Other bits may be used in the future; use a simple bit
                test rather than checking for specific word values.
16 words        palette
16000 words     picture data (screen memory)
4 words         left color animtion limit table (starting color
numbers)
4 words         right color animation limit table (ending color
numbers)
4 words         animation channel direction flag (0 = left, 1 = off, 2
= right)
4 words         128 - animation channel delay in 1/60's of a second.
[0 - 128]
                (I.e., subtract word from 128 to get 1/60th's of a
second.)
-----------
32066 bytes     total

<DEGAS Elite (Compressed)>      *.PC1 (low resolution)
                                *.PC2 (medium resolution)
                                *.PC3 (high resolution)

1 word          resolution (same as Degas, but high order bit is set;
                i.e., hex 8000 = low res, hex 8001 = medium res,
                hex 8002 = high res).  Other bits may be used in the
                future; use a simple bit test rather than checking
                for specific word values.
16 words        palette
< 32000 bytes   control/data bytes
4 words         left color animation limit table (starting color
```

numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag [0 = left, 1 = off, 2 = right]
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
         (I.e., subtract word from 128 to get 1/60th's of a second.)

< 32066 bytes total

Compression Scheme:

PackBits compression is used (see below). Each scan line is compressed separately; i.e., all data for a given scan line appears before any data for the next scan line. The scan lines are specified from top to bottom (i.e., 0 is first). For each scan line, all the data for a given bit plane appears before any data for the next higher order bit plane. Note that this is identical to the IFF 'BODY' image data.

To clarify: The first data in the file will be the data for the lowest order bit plane of scan line zero, followed by the data for the next higher order bit plane of scan line zero, etc., until all bit planes have been specified for scan line zero. The next data in the file will be the data for the lowest order bit plane of scan line one, followed by the data for the next higher order bit plane of scan line one, etc., until all bit planes have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on compressed DEGAS files:

- o Elite uses a 40-byte buffer to store data being decompressed.

- o Whenever a control command is encountered, bytes are stuffed in this buffer.

- o The buffer is only emptied when there are EXACTLY 40 characters in it.

The important conclusion here is that

> No control command may cause the buffer to have more than 40 bytes in it. In other words, all control commands must end on or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus error when the picture is loaded.

...<</PICFMT.DOC>>

eek! Basic! run away - run away! :-)

Looks something like you're drawing directly on a canvas above (I dunno any VB btw). Have you considered a direct file conversion? I had a quick peek at the Win95 programmer's docs. A direct conversion doesn't seem wholly impossible. These datatypes are worth perusing...

I just discovered that wind_set(handle,WF_KIND,kind) doesn't work. I'm
using PureC and it's GEM library. Is it a bug in GEM or in PureC's GEM
bindings? Anyone any info on this?

I think the WF_KIND is a dummy for wind_ser. You must specify the window gadgets
in wind_create's first parameter.
You cannot remove or add window gadgets dynamicly once the window is created.

I never thought to try it outside of wind_create(). If it does work
then it would require a new message to "update the app" would it not?

OK, but I wonder why not. And what is WF_KIND for, then? It's a dummy,
you say, but what does that mean? PureC's documentation suggests
otherwise:

```
WF_KIND        legt wi_sw1 als neue Fensterkomponenten fest, Format
               wie bei wind_create.
```

(wi_sw1 is the first parameter after WF_KIND).

Ok, sources of net2net are lost, so I want to try this way, going on patching it until I find a start (a PC C source) to replace it completely.
There are only few problems in net2net so I this samll patches will be enough.

So: HOW TO PATCH THIS GFA .TTP program ? I am ready to listen from your experience about:

- how to disassemble/trace the code to locate where in the program is the part of the code that has to bee patched

- the way to redirect the calls to new routines

- how to add the new code to the program

- all other hints that can help me

The first thing I need is to make net2net write the headers in a different way to fix the file attach programs, no you can't just change the strings with an hex editor, because the string are not null terminated, I need longer strings and avoid some CR/LF.

PLEASE HELP ME, this will be useful to the Atarians world I hope 8^)

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

I used 'think' in one of its meanings: "could as well be wrong". :-)
But one never knows, you could try if it has effect when you close the window
after
the wind_set, and then open it again. May I have a guess what you are trying?
Remove sliders when they would be set to full size. ?

Hi Jos!

JDB>OK, but I wonder why not. And what is WF_KIND for, then? It's a
JDB>dummy, you say, but what does that mean? PureC's documentation

JDB>suggests otherwise:
JDB>
JDB>WF_KIND legt wi_sw1 als neue Fensterkomponenten fest, Format
JDB> wie bei wind_create.
Only a suspicion (I have no experinence with that):
Have you tried to close the window, do the wind_set(WF_KIND) and then open it again?

Bye

Joerg

Do you mean wind_close() only? No, I haven't tried that. But as far as
I know, wind_open() after wind_close() tops the window, and that I
don't want. In that case I might as well use wind_delete() and
wind_create(); wind_open(); which allows me to change gadgets as I
please anyway.

>experience about:

Horrible job, however you look at it! That said, I'd try for an
approach whereby you disassemble the whole thing in such a way that an
assembler can reproduce the exact binary you started with.

>- how to disassemble/trace the code to locate where in the program is the
>part of the code that has to bee patched

Others will know of specific programs. Something called "MON" comes to
mind - iirc its a system monitor that'll trap selected OS calls, set
breakpoints etc.

>- the way to redirect the calls to new routines

Find out as much as you can about GFA's compiler. Does it generate
absolute or PC relative code, under what circumstances does it do
each, etc. You'll need to know how it treats its "stack frame" and
register usage to do anything effective.

If you have GFA then perhaps you could figure out a rough guide
yourself by compiling various bits of test code - see how it generates
a function call - that kind of thing.

>- how to add the new code to the program

A decision made based on the asm you're trying to hack at the time.
You'll need space to insert a JSR (possibly a BSR). In some
circumstances you might be able to get away with just slapping a JSR
over some code, doing your stuff, then tagging the overwritten code
onto the end of your routine before it returns. Compilers are
inefficient. You should easily be able to spot "optimisations" which
allow you to get the job done in less bytes, and thus be able to
obtain space to insert a JSR. You must know enough about the compiler
though - no good doing that if miles away there is code that jumps

directly to something you've altered (or does something even more subtle).

>- all other hints that can help me

Given that...

1)
You can disassemble the prog such that an assembler can rebuild a byte identical copy

2)
You've sussed enough about the compiled code to know your changes have no side-effects

...then you can make changes to the dissassembled code. Your JSR's can jump to code tagged onto the end of the disassembly.

Figuring out how GFA constructs function calls would be my first approach. This at least would allow you to follow the program flow, search for calls to "this" function and may even lead to you being able to "hijack" a chosen function - ie pull the whole lot out of the program body and put it elsewhere, whereby the original function space just has a JSR/JMP to wherever you've moved it. When you can reliably do that then you're on a winner - because you can then construct a stack frame for your compiler and start adding the intended patch code.

>The first thing I need is to make net2net write the headers in a different
>way to fix the file attach programs, no you can't just change the strings
>with an hex editor, because the string are not null terminated, I need longer
>strings and avoid some CR/LF.

Another thing to be figured - how GFA generates string handling code!

>PLEASE HELP ME, this will be useful to the Atarians world I hope 8^)

Good Luck!! :-))

Excellent explanation. The disassembler that can do this? See my sig.
Have fun.

I would like to program in C language on my ATARI STE1040. Where can I find
a compiler

 Thanks.

Hello,

    You might want to try ftp://atari.archive.umich.edu/, subdirs

~/Programming and ~/Languages. There are quite a lot of free C compilers in binary form, but if you're looking for a *free* C compiler, there is gcc (GNU C Compiler) for ST available in source. It is command-line, though.

Good luck,

Grega

The best free compiler for Atari STE1040 is the SozobonX. The GCC is not avaible for this computer

it need to much memory!

Hi

I have a little problem with my GFA BASIC program,
I wonder if you could help me. I would be *very*
grateful. The whole thing is that I cannot detect
doubleclick under TOS 2.06 (everything works
perfectly OK with TOS 1.0, though.) I'm doing it like
this:

```
-- cut here --
ON MENU BUTTON 3,1,1 GOSUB click
DO
   ON MENU
LOOP
PROCEDURE click
   SELECT MENU(15)
      CASE 1
         (singleclick occured - do.something)
      CASE 2
         (doubleclick occured - do.something.else)
   ENDSELECT
RETURN
-- cut here ---
```

In the manual it is clearly said that in MENU(15) I should
find the number of mouseclicks. But under TOS 2.06 there

is just 0 or 1 (never 2); under GENEVA it is always
zero there.... Yes, my program does not recognise ANY
mouseclicks under Geneva. Why? I cannot resign from using
the mouse :) or even just form doubleclicks. There is nothing
wrong w/ my TOS 2.06 or Geneva, since applications like QED ,CAB
or any other work OK. In fact under GENEVA even

```
-- cut here---
ON KEY GOSUB keybp
DO
  ON MENU
LOOP
--cut here---
```

does not work at all (procedure keybp is never executed.)
Those bugs happen both under the interpreter, and after
compiling the program. Please, help me, I dont know what
am I doing wrong, and I would like my program to work
not only under TOS 1.0 (who uses it now?) but also
with other systems. Please. ;)

Pozdrawiam,
Grzesiek

Try wind_set(0, WF_NEWDESK, NULL, 0); I think that will work.

For over 10 years I have been programming VME Single Board Computers (SBCs) having MC68K cpus
using the Atari. The system compiles and links a C program using the old Megamax compiler and linker.
Another program changes the header in the compiled and linked program and produces relocatible code.
Another program then produces an S-record file for loading into the SBC. The system can and has been
modified for a variety of SBCs from different manufacturers. A macro library also exists to allow
programming the MC68881/2 floating point coprocessor. I was wondering if anyone else has interest in
such a system.

Hi..
i'm looking for a source code (ithink published in ST-mag) called Robot war
(la guerre des robots in french).
This was a game in GFA Basic where you must create a robot... The goal is to
p⍰t it in a maze with other robot and the war is started... If you were the
lastest one u won...

Anyone got it ????
please e-mail chevalier_max@yahoo.fr
